Brad,

Not being that familiar with this particular radio, I don't know if it's an FCC "Type Accepted" radio for Public Safety use.

If not, then it's a moot point because you're NOT supposed to be using it in those bands!

This has become a real problem with a lot of Public Safety entities in that the Amateur Radio equipment is "MUCH" cheaper than Commercial equipment. I understand the problem because I'm the Radio Tech for our local County government.

Here's the real problem:

First: The equipment either doesn't meet the FCC requirements for all kinds of criteria established for Commercial operations, OR it DOES meet them, but because the FCC has been hamstrung by the Federal government, money wise, it can't possibly test EVERY brand of radio for the specifications required.

Second: More importantly, "IF" you ARE using a NON-Type Accepted radio and the FCC were to catch wind about it...not only would YOU be in trouble (some serious fines!) but the agency you are working with or for would quite possibly loose THEIR license to operate on those frequencies. Basically, they'd be shut down! NOT something "I'd" want to be responsible for!

So, my recommendation in all this is: Find out if your radio is Type Accepted for Commercial use!

If not, STOP using it for that and go on line (Ebay is a great source) and buy a Commercial Type Accepted radio!

Depending on what radio you purchase, you may even be able to find programming software and programming cables for them.

My preference would be a Kenwood, but again, that's "MY" preference! By the way, the radio "MUST" be capable of being Narrowbanded!!! There will be a horrendous amount of Commercial VHF & UHF equipment on the market and MOST of that won't be narrowband capable because of the FCC requirement/deadline of December 31st, 2012 for Narrowbanding of ALL Commercial VHF & UHF equipment!

Everyone is scrambling to buy the new equipment and dumping the old! So be careful in your selection!

Subject: [baofeng_uv5r] Public Safety Frequencies - More Sensitivity

I was on a SAR mission last night, my first with the UV-5R. Comm is always a problem on missions but my UV-5R was totally useless in the public safety band. I was very disappointed. I need to know what (if anything) I can do to improve my Rx sensitivity in the 155MHz band.

Here's the details:
I was using a UV-5R with a NA-771 15" V/UHF antenna. We use high band VHF public safety frequencies, narrow FM. The UV-5R programs fine and tests fine. During real-world (canyons, dense foliage, cliff bands, etc) use however, it does not do well.

The rest of my team uses nice ICOM radios and had perfect signal quality 95% of the mission (comm is always a problem). Yet, my radio rarely hit the squelch level and was not intelligible when it did. Based on other reviews of my NA-771 antenna, the quality is questionable lately.

Is the sensitivity of the UV-5R that bad relative to the ICOMs? Would a different HT be better (e.g. Wouxon KG-UV6D or KG-UV2D)? Is there another antenna I should try?

Thanks all,
-Brad

5568. 3.79 antenna

Hi..

Nothing new here because this material has been posted before by other group members. Lots of interest, so I found the old posts with this information and gave this message a very searchable title.

Link to pictures and review....

http://hamgear.wordpress.com/2012/07/10/the-3-79-antenna-review/

Following the recommendations of others, I purchased mine from ebay seller "sworldwideseller", for 3.79$US. Ads are headed with...

"Female universal Antenna for Kenwood HYT PUXING QUANSHENG WOUXUN(UHF&VHF)"

Length is about 15cm; it is flexible enough that it came in an envelope, almost bent doubled back on itself. Popped straight up when it was removed. When installed, there is no gap between the body of the radio and the antenna base; the fit is flush and very good, just like the factory unit. It looks good and is not expensive, works slightly better than the stock unit, and is extremely flexible. If you need the flexibility or the slightly greater range, than get it. But, the stock antenna is pretty good, too; putting this on will not get you a DXCC award on UHF.

Hi Andy.

No the Diamond stubby I have is a fake dud. The two good ones I have are unbranded BNC A-157. I can open the GB3LA repeater from the front bedroom, a distance of more than 50 miles, with them, using the UV-5R on high power. If the new one can do that I'll be more than happy.

The 5R is Part 90 approved and does narrow band. It does attract a large number of inexperienced users. I maintain about 250 radios and have used the 5R and Wouxuns as test radios because they are easy to program in the field and they have the 'Reverse' button that simulates repeater setup. They are fully functional radios and have been reliable. Their primary weakness is in Scan- they do not have the professional scan setup found in Kenwood TK-3302 or Motorola CP200/PR400. But for listening and talking they just work.

Correct.

Gil, ABQ, here's what you need to do.

When you are entering a frequency, be sure to set menu 10 (R-DCS) to OFF.
Also set menu 11 (R-CTCS) to OFF.

Sub-audible and digital tones are very helpful, but if it's new to you, it
can be frustrating.

The green "light" indicates that the radio is receiving the repeater, but
you are not hearing that repeater because your radio thinks that it also
needs to hear a specific sub-audible tone. By setting R-DCS and R-CTCS to
OFF, you should be able to hear the repeater when the green "light" is ON.

Sensitivity of the UV-5R is fine. Selectivity is not. If you're living in an RF polluted area, the receiver will sort of shut down under the pressure of all those signals. The better the antenna, the worse it will get.

The reason behind this is that the Baofeng UV-5R is SDR-based. Software Defined Radio is cutting edge technology which makes it possible to produce units at very low price. However, in this price range SDR is also a guarantee that the receiver won't be able to cope with the negative influence of unwanted (out-of-band) signals. SDR can't replace proven technology such as mechanical filters and cavities.

If I look at the lab tests I did on Japanese and Chinese radios, one thing is sure: the more conventional the design, the better the receiver generally is.

I like my UV-5R, but I'm well aware of its flaws and limitations.

Hans / PD0AC

5575. new users/primer on "tone squelch"

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-05 17:42:17 UTC
From: Dave Schultheis
Topic: 5575 Message: 5575

This link *may* help some new hams understand the usage of continuous tone-coded squelch systems, otherwise known as "PL" (trademark Motorola), "Channel Guard" (trademark General Electric), "Quiet Channel" (trademark RCA), and a few others.

http://en.wikipedia.org/wiki/Continuous_Tone-Coded_Squelch_System

For many ham radio operators, "tone" is used to prevent far-away weak signals from keying the local repeater. Every user must transmit on the proper frequency AND with the proper tone encoded on their signal.

Users in the far-away area will transmit on the same frequency but with a different "tone," which allows both repeaters to co-exist peacefully without interference or inconvenience to either group. At least, that's what's supposed to happen.

Some repeaters also transmit (ENCODE) "tone" on the repeater output. This allows users to put their radios into DECODE mode, where they only hear the local repeater. But if the repeater does not ENCODE tone on the output, those who are listening in DECODE will not hear the repeater at all.

I have found that generally speaking, it is best to enter channels into portable radios without using tone DECODE. When you are completely sure that the repeater is ENCODING tone, then you can put your radio into DECODE (R-DCS or R-CTCS with the UV-5R) if you want, but it's frequently not necessary.

Jim -

What type of file are you downloading? If it is an ".exe" file, it will install the drivers directly to the system32 folder in windows and will also update the registry with the appropriate information. BTW, the file name for the installed prolific drivers (in the system32 folder) is likely usb2ser.sys or something similar. In most cases, it might be necessary to uninstall the old (dysfunctional driver) and reboot BEFORE running the .exe file to install the correct driver.

On the other hand, if the downloaded driver folder does not contain an .exe type file, it should contain, in addition to other files, an ".inf" file. This "inf" file is the one you would have to point to when updating/re-installing drivers from Device Manager. This file contains instructions to enable WIndows to find and install the drivers.

If none of this makes any sense to you, you'll probably need to find a friend that knows computers to help you out. It's very difficult to do this effectively in an email without knowing ALL of the variables.

Good luck,
John

I guess, in my ignorance, I assumed that if the radio was approved by the FCC from 136-174 MHz, that using it at 155 MHz was perfectly legal.

If this is not the case, can someone please tell me where I can find those restrictions? We operate under a state license that I don't want to compromise. How do I know if this is "Type Accepted"?

Is there a cheap Chinese HT that is approved for commercial use?

Thanks,
Brad

Public Safety, business, etc, are covered under Part 90 of the FCC rules.

There is a sticker on the Baofeng UV-5R, it is under the battery. It states that it is compliant with Part 90 of the FCC rules.

The sticker also has the FCC ID number. Google that, and you will find a page on the FCC web site with the exhibits that certify compliance with Part 90.

A number of other inexpensive Chinese radios (some Wouxun, etc) are also compliant with Part 90.

73,
Ron KR2D

I don't see anything, anywhere, on the radio/on the box/in the manual that says these radios are type accepted for anything at all. As opposed to something like my Yaesu that has a very clear FCC ID number on the model tag on the back of the radio.

Generally speaking, ham gear doesn't need to be type accepted. It's assumed that since we're all licensed, we have enough technical know how to make sure our gear works as intended (of course, it can be very easily argued that with the latest crop of tech class license holders many of them don't have a friggen clue, but that's a debate for another time).

I particularly liked the reference to gambling - " It's addictive, but
often you lose. You win often enough to keep you coming back in the hope of
finding that absolute bargain. "

Honestly, considering how relatively inexpensive a decent antenna is at
some place like HRO, I don't understand why people even bother with these
ebay antennas (yes, I fully understand the irony of that statement given
what radio this group is about, lol)

I know that this radio complies with Part 90. So is Part 90 the same as "Type Acceptance"?

5583. Re: One More Time with the driver....

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-05 19:31:15 UTC
From: Jim
Topic: 5547 Message: 5583

Jim,
I just messed up my drivers so I could help you. Hopefully I can get you all fixed up as I fix mine.

Hopefully you are using the "Win7Vista_64bit_ProlificUSB_v3200.exe" driver file from the files area. If not, download it and note where it is saved.

This step may not be necessary but let's do it so that we both start in the same place. Plug in your USB programming cable. Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.

With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.

Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.

Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!

You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

That should be it. Good luck and have fun programming your UV-5R.

> >
> > My apologies to the group because I know this has been covered ad nauseum but I am still having issues. The interface works fine on my laptop running XP. I have been trying to get it to run on my Win7 machine with no luck. I have down loaded the drivers as recommended, restarted my machine, and attempted to update the driver by picking the newly installed driver. Here is my problem...where is it? I have searched my computer, looked in the drivers folders and have not been able to find any driver named Winvista7prolific.etc driver. How or where do I go to specify that driver? Thanks!!!!

Aha ok.

I've just been comparing mine again to the Nagoya 701 and it's
pretty close to it even on 2m.

I would definatly buy these stubbies again, in fact I will probably
order a few more for spares fairly soon ;-)

Please take this with the humor in which it was intended...

Why would you need Spare stubby antennas.
Do you loose them, wear them out, or melt them with 4 watts? :-)

They melt when I switch my burner on good buddy ;-))

Well the truth is I own a LOT of handhelds, plus I often carry
two antennas around when hiking etc and so *occasionally* I do
lose antennas.

Also with other rubber ducks I like to keep spares because they
sometime get quite bent, and I do like to keep my stuff in first
class condition, so I keep spares of everything.

Batteries, ptt rubbers,cases. It's all so cheap.

With luck I'll still be using my $50 rigs LONG after everyone else
has trashed them.

When you are completely sure that the repeater is ENCODING tone, then you can put your radio into DECODE (R-DCS or R-CTCS with the UV-5R) if you want, but it's frequently not necessary.
>
> Dave Schultheis
> WB6KHP San Jose

Dave, thank you! All of the programming instructions I have seen have shown entering tones for both RX and TX, yet my mobile rig is not set up this way, but set up to encode (tone on TX) only, and functions as I want it. I did not understand why or if RX tone was necessary or desirable.

Our local repeaters do not use tones, but for one. I was asked to program a UV-5R for a friend in another area and he did not know if the tones were retransmitted by those repeaters or not. So I see now it is best I do not program in receive tones in this situation.

Thank you for your explanation.

Look at www.importcommunication.com
Wouxun or UV-5R are good for commercial.

The USA Code of Federal Regulations (CFR) is made up of 50 Titles
http://www.cfrpublications.com/

Title 47 covers Telecommunications and is divided into more than 80 parts. The 'Parts' that most interest UV-5R owners are:

PART 90□PRIVATE LAND MOBILE RADIO SERVICES
PART 95□PERSONAL RADIO SERVICES
PART 97□AMATEUR RADIO SERVICE

These 'Parts' are the Federal Communications Commission (FCC) rules for these services. You can download these rules by substituting "90", "95" or "97" for the "[NN}" in the following URL.

http://www.gpo.gov/fdsys/pkg/CFR-2009-title47-vol5/pdf/CFR-2009-title47-vol5-part[NN].pdf

Type approved for Part NN, Type accepted for Part NN, Part NN compliant, and etc. generally mean the same thing.

Newer UV-5R HTs have the FCC sticker on the inside (under the battery). There is a picture of a sticker in the Pictures area of this group. It says "This device complies with Part 90 of the FCC rules." This means that a UV-5R with this sticker can be used for the Private Land Mobile Radio Services. Any UV-5R can also be used for the Amateur Radio Service because PART 97 doesn't require equipment operated within the rules of that service to be type accepted. No UV-5R, that I am aware of, complies with Part 95 of the FCC rules so the UV-5R shouldn't be used for the Personal Radio Services (which includes FRS, GMRS and MURS).

Aggieoutlaw: (?)

No. "Part 90" refers to a specific section of the FCC rules. "Type Acceptance" is when the FCC certifies that a particular radio is compliance with the rules for a specific type of service. The "Grant of Authorization" document for the radio specifies service(s) for which it has received type acceptance. A radio, must include a label that includes the part of the rules under which it has been accepted and include the FCC ID number.

You can search for the documents related to type acceptance of particular radios on the FCC Web site.

http://transition.fcc.gov/oet/ea/fccid/

Enter the FCC ID that's on the label. The first 3 characters are the "Grantee" code. If you put that in only, you'll get a list of the information for all IDs for that grantee (manufacturer).

Try putting in just "ZP5".

I suppose this brings up the need for another FAQ. One that relates to what these radios may be used for, at least in the U.S. I suspect that some are sold to people who don't realize they need to have a license to use them--which would seem to include some of the people on this list.

That was interesting. Thanks for posting it Tore. I too liked the reference to eBay as addictive gambling. Got that bug, I admit.
More evidence that the "blue ones" range from "barely fair" to downright "not even an antenna". There are some genuine Nagoya models that are dogs too, (The 773 telescopic is oft cited), but our otherwise reliable Chinese vendors like 409 in its various iterations need to be made aware of the counterfeit problem, and that "we" are getting wise to it.

I particularly liked the reference to gambling - "
It's addictive, but often you lose. You win often enough to keep you coming back in the hope of finding that absolute bargain. "

Honestly, considering how relatively inexpensive a decent antenna is at some place like HRO, I don't understand why people even bother with these ebay antennas (yes, I fully understand the irony of that statement given what radio this group is about, lol)

I agree. It says at the bottom of each page that "All radios are FCC Type 90 Certified".

When they are not, like the pre-production WOUXUN KG-UV920R dual-band mobile radio, it is clearly spelled out on the details page that it is not.

* Do not have 2.5 kHz Tuning Step
* Are not FCC Part 90 certified

So if having part 90 certification is important to you, seek out importcommunications.com for a certified radio.

You're welcome. And just a follow-up on this.

The distinction I draw is for a portable radio. Things may be different with a mobile radio used at home, particularly when used with a base station antenna.

In that case, you may possibly hear the distant repeater, so you may want to store that frequency in your mobile radio with DECODE, so that you can only hear the LOCAL repeater.

And there are people who will store the frequency and ctcss tone for the distant repeater in a different memory channel, in case they want to listen to the distant repeater, or maybe even talk to them, depending upon the circumstances.

I wrote the company, Reuex Industrial Co, that make Nagoya and they do
in fact make blue lettering. Just because it has blue lettering does not mean its
non-genuine.

Also I prefer the Chipw open source programming software to the company software. You can
move memories up-down-delete etc at will.
Also change the power-on message to your ham call etc.

Thanks

Topic: 5547 Message: 5605

Just went through this myself, after having just accepted that I'd only be able to do this on XP (which frankly, is no big deal to me, as I have a laptop here that is dedicated to doing the programming on my drag car, so it really is no problem to also use it for radio programming).

For the heck of it, I went through this again on my Win7 laptop, and found one part that didn't match up with Jim's guide. Specifically, the driver does NOT populate as " "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" on my system, but rather only "Prolific USB-to-Serial Comm Port" (it drops the version and date info).

Again, to me, no big deal. I'm a Communications Tech-slash-IT support Tech for my company, and it was a trivial matter to check the dates in the driver properties to find that it is in fact the correct driver, although I also made sure to remove all bits of the newer driver when I gave up attempting to use the Win7 laptop earlier (yeah yeah yeah..I know..an IT tech shouldn't give up so easily..should have been a challenge accepted...I just didn't care that much :D)

That said, to those less computer savvy, this could well be a point of confusion.....

Oh, and yes, it DOES now work on my Win7 laptop, at least through the Baofeng software (happy dance!! :D) . I haven't tried it on CHIRP yet

Right. So without reading Title 47 in its entirety, should I not be allowed to rely on the FCC certification label on the radio?

When I bought the radio, I looked for and found the FCC label. The radio is also clearly marked with a range of operating frequencies.

All I need to know is this: Why would I not be allowed to operate this radio within those frequencies when properly licensed to do so?

It sounds like the answer is: There is no reason, the radio is perfectly legal when operated this way.

If I'm wrong please let me know.

Thanks,
-Brad

Yep, works in CHIRP too! Although, sadly, I couldn't get the power on
messages to show. What a piece of crap! /sarcasm :P

Thanks for that info. The plastic sleeve the antenna came in says "Reuex Industrial Co, Ltd". (It also claims the antenna has a "Flexiable Spring Whip") There is a silver hologram label with "Nagoya Antenna" and a serial number too small for me to read that I presume is meant to show that it is genuine.

I guess it is the real thing and it performs as well as it was meant to.

So, does anybody sell an antenna for the UV5R that actually does have a 2:1 SWR? Does a US shop have a replacement antenna that's actually better than the stock antenna?

Would it be worth tearing apart one of these 771 antennas and soldering a piece of spring wire on it to make your own antenna that might actually be unity gain?

I'm willing to tear my Nagoya apart and use the connector with something else, and it does not improve anything except reception of the 88-108FM music band!

Brad:

I'd say that as long as there's no reason to assume the labeling or the radio is not legitimate, that you're pretty safe using a properly labeled radio for the indicated service. At least you have a good argument if it turns out otherwise. It's easy to check the FCC ID number on-line, so anyone who buys radios for professional work should make it a practice to check the labeling and the certification online--and should probably spot-check the radios for proper operation.

I also believe that each individual radio does have to have the label on it for it to be used in the US though (excluding Ham use).

So, yes, if properly labeled for your service, you are allowed to operate the radio within the frequencies specified for that service. There is one caveat, you have to operate on the frequencies, modes and power specified in your license.

Hi,

I also e-mailed Reuex (Nagoya) yesterday, because I had bought a
NA-701 which was printed on in blue instead of the "usual"
silver-on-black label.

This is the answer I got:

Dear Sir,

Yes we now make the NA-701 with printing instead of stickers.

best regards,

Tony Cheng / Sales Dept.
Reuex Industrial Co., Ltd.

Hi,

There are four antennas locally, all BNC versions of the Nagoya 771.

Two have silver (chrome) lettering on a back background. Two have blue lettering.

The blue ones I own, and they are slightly longer than the "silver" ones. I have yet to check the "silver" VSWR, but the blue ones are not good..

I noted that the UV-5R showed PA instability when coupled to a "blue" Nagoya. And I also know that touching the (insulated) "blue" antenna reduces the VSWR. (Hand capacity).

I am not sure if I have fakes. I am going to try a little silver foil around the "loading coil" of the "blue" antennas, (with tape to prevent a shorted turn) in an attempt to lower the resonant frequency of the antenna. (Assuming it does have a loading coil, and works as a 5/8 on 70cms). Interestingly, the sleeve it came in gave a gain of 2.15dB on 2M, (compared to isotropic, probably!) and a gain of 3dB on 70cms. (Compared to a 1/4 wave on 70cms, assuming the antenna is supposed to be a 5/8 vertical).

Caveat Emptor!

It has been an eye opener. My Comet CH72S (in excellent condition, 22 years old and probably not a fake) is none too clever on 2M. OK on 70cms. And a range of other antennas intended for HT use are not that good.

The best?

The original antenna from my FT790 (YHA-44D, flexible half wave with matching at the bottom) is 1:1 on 70cms, and a telescopic antenna I got a long time back from the British company "Maplins" can easily be adjusted to 1:1 on both bands.

The dual band antenna supplied with my Standard C500 (also "rather old, but good) is none too shabby on both bands. Actual QSO results bear out the "good" VSWR performance (No lift conditions, the Yaesu antenna successfully accessed a repeater on 70cms, 40 miles away, my shack is on the "wrong" side of the house, at ground level, but it is a pretty good path otherwise..!!).

Test setup is an adaptor in the back of the Diamnond SX1000 VSWR meter, and the test antenna connected to the adaptor. If I substitute a decent dummy load instead of the antenna, the VSWR is 1:1, so the setup appears fair. I have repeated the tests with the UV-5R and my Standard C500, and apart from the instability noted for the UV-5R, the results are the same.

I have the original Baofeng antennas from the UV-3R+plus, (no moulded writing on it), and the "same" antenna (with moulded writing on it) from the UV-5R.

UV-3R antenna, 2M, 10:1 and on 70cms 2:1

UV-5R antenna, 2M, 1.9:1 and on 70cms 2:1

For the 70cms test, I added a "radial" at the base of the antenna, as I had to use two adaptors, which had upset things a bit.

So even Baofeng antennas are not the same, although you would have thought so.

I also have a Maldol "Action Hunter" stubby. Again, old. Pretty poor, resonant at too high a frequency on 70cms, but hand capacity will bring it to 1.5:1, again, too high on 2M, but hand capacity lowers it to 1.8:1

This last result is probably a good compromise, in that the "normal" position of the handheld will result in the stubby being close to the face, so "face capacity" may well get it somewhere close. Just don't move, or speak, Hi! This antenna has an (expected) high "Q", so is probably acceptable.

The best dual band antenna (for VSWR) has been the adjustable telescopic. But it is possible to set it incorrectly.....

The Chinese antennas are not good, the Japanese aftermarket one is fair.

I feel an "antenna party" coming on.. To make my own.

73 de Stan, G4EGH.

Just got the UV-5R in the UK and programmed it manually, no USB/computer, and although the voice says; "Scanning begins", it doesn't.

It has BFB251 120702 Ver-05 software, menu 7 TDR is off. VFO scans all frequencies OK. Is there a way to scan just part of the bands?

Ordered a USB cable but it might be month for delivery.

Any clues, thanks.

Not about the scanning, but <http://www.uv3r.com/> sells the cables from
the UK.

Look down the page for the Kenwood programing cable.

Geoff.

I have followed your advice and successfully installed Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007].
Great
or not....

I select com port 6(the right port for the driver install and
usb port used) and confirm this in the Baofeng program.
I then switch on the radio whilst connected to the cable and select
"read data from radio",
the message "Fail connect with transceiver" is emblazoned across my eyeballs even when I try to sleep.
This is maddening, and with the amount of time Ive spent trying to get it to talk to Win 7 64 pro, I could have repaired my XP dual boot.
Which to be honest seems to be the best bet at the moment.

Suggestions would be most appreciated.

RIK

>
> This step may not be necessary but let's do it so that we both start in the same place. Plug in your USB programming cable. Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.
>
> With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.
>
> Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.
>
> Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This

next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!
>
> You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

I believe that would be illegal. I may be wrong but I Kinda remember something about that in the regs.

As I posted before!
If you will get a cable with the FTDI chipset/drivers and is Windows 7 compatible your problems will be solved.
No having to try out different drivers etc. Just install it with the drivers supplied or latest drivers from the FTDI web site and good to go on ANY windows platform.

Subject: [baofeng_uv5r] Re: One More Time with the driver....

I have followed your advice and successfully installed Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007].
Great
or not....

I select com port 6(the right port for the driver install and usb port used) and confirm this in the Baofeng program.
I then switch on the radio whilst connected to the cable and select "read data from radio", the message "Fail connect with transceiver" is emblazoned across my eyeballs even when I try to sleep.
This is maddening, and with the amount of time Ive spent trying to get it to talk to Win 7 64 pro, I could have repaired my XP dual boot.
Which to be honest seems to be the best bet at the moment.

Suggestions would be most appreciated.

Check your cable on the right side of the UV5R. Sometimes it is VERY hard to plug it ALL THE WAY IN. You might think it is all the way in, but push harder. It will snap on in. Then the program will read the radio.

Topic: 5616 Message: 5625

Without programming software, there is no known way to set a channel to not scan. They should all be scanned. About the only way they would be skipped is if you programmed a receive CTCSS tone for all of them and none of the stations listened to transmit one. But then you wouldn't hear anything when tuned to a single channel either. Would you maybe give us the programming particulars for at least one of the channels that you say doesn't scan. Jim KC9HI

Make sure the cable is fully plugged into the UV-5R. Many require a firm push to get the job done.

If you are running Win7, you need the driver version 3200, which is old. Make sure Win does not attempt to update it at install time, (disconnect PC from the Internet), and subsequently.

The stable Chirp build does not support the UV-5R. The Chirp daily build does, so you need that. Visit the Chirp site to get the latest build. There is also a version of the Baofeng software (latest) that supports the 5R

(*sigh*).

Maybe we should just delete everything in this group and replace it with the set of instructions a copy of the drivers.

At the bottom of the instructions, we will give the address of a new, real group.

You will need to down Chirp from their Daily Builds section. The
stable-release version does not have the newest code, some of which is
used to make the UV-5R work.

Well this embarrassing but I got that annoyed I switched the UV-5R off and left it. Tried it again just now and it now scans. I don't remember reading anything about that.

The channels are mostly UK VHF simplex S16 to S23 and ditto on the UHF, all the 2m/70cm repeater freqs.

Thanks for the cable suggestion but as per my first post I've already bought one but there will be a months delay for delivery.

Thanks.

--- In baofeng_uv5r@...m, "Jim" <jru.uv5r@...> wrote:
>
> Without programming software, there is no known way to set a channel to not scan. They should all be scanned. About the only way they would be skipped is if you programmed a receive CTCSS tone for all of them and none of the stations listened to transmit one. But then you wouldn't hear anything when tuned to a single channel either. Would you maybe give us the programming particulars for at least one of the channels that you say doesn't scan.

(*sigh*).

Maybe we should just delete everything in this group and replace it with the set of instructions a copy of the drivers.

At the bottom of the instructions, we will give the address of a new, real group.

If you downloaded the daily build that WOULDN'T have happened.

People need to read the instructions. They may not be 100% perfect. They might need some tweaking to be clearer. But they absolutely DO work.

What is clear is that some people aren't getting the message.

You obviously haven't downloaded the daily build if it's not showing the
UV-5R option.

It's actually not so easy to find documentation for obscure devices.
I'm better at it than most, but there is still no concise FAQ, howto,
and lookup table of what all the thingies mean - and certainly not all
in one place. This is common across a range of projects. Please be
patient with your users.

Dealing with device drivers can be a pain. It was a pain on my OSX
machine, and it took me a while to figure out which supporting libraries
I needed on some kinda Linux VM to compile Chirp for it. Luckily, I
found someone (in this list!) that mentioned where to get the right
driver for OSX, and I was able to install and use it.

I am having a blast with my UV-5R, and have it setup to scan the local
repeaters and now I can monitor EMS transmissions without fear of
accidentally transmitting outside of my license: duplex=off not none.
Took some digging.

The drivers i downloaded are for the COM port (which i installed) but i am using a USB serial BUS. The radio seems to be responding (red light blinking, stops blinking) but the software just says it could not complete to action.

The instructions and drivers have been pointed to multiple times on this forum.

Several folks have tried to make the process as clear as possible, but it's just not working.

Tygre,
Yes. The software uses a COM port. The programming cable has a USB-to-serial chip in it and that is what the drivers are for. Do you have the drivers installed properly? You should be able to go into Device Manager and check the version. It should be version 3.2.0.0 with a year of 2007. If it is newer than that, then you don't have the right driver installed yet. If that is the case, then go back and read my message 5583 to Jim. It should help you with the driver.

http://groups.yahoo.com/group/baofeng_uv5r/message/5583

If you don't have the driver installed correctly, there is no need to be messing with the CHIRP or Baofeng software yet. One step at a time.

Suggest you download FindComPort.exe from www.importcommunications.com and use it to verify your Com Port Number assigned.
Use the found Com Port in the programming software.
Make sure the two pin cable is fully engaged in the radio- press HARD.
Try multiple reads- sometimes it takes a couple of reads to wake up the radio.
Let us know what happens.

Tygre,
I'm helping you. My UV-5R, cable and software is working great. The only reason for me to be here is to help. And once in awhile I learn something. Bonus!

5649. hi sorry to ask but another programming software issue

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-06 23:21:06 UTC
From: radiobf5r
Topic: 5649 Message: 5649

I have searched the files but this problem appears to be a bit odd.

I have followed the driver installation instructions and this has worked fine. When i use Chirp it reads the radio fine but when using the BF5R software it throws up a run time error when trying to read the radio.

To me it looks like the driver is fine but when using either the original software that came with the radio or the version 2 i get this error.

Some may ask why i want to use the original software and not chirp and the answer is i need alpha tags on my memory programming.

Many thanks in advance.

I really appreciate it Jim. I have made great strides in the past 10 minutes. I can import my currentlist to Chirp from my radio but when i try and import nothing happens.

Thanks for the replies,
But believe it or not I managed to get it to work .
The radio end of the cable has to be pushed VERY hard into the two
jack sockets (maybe the pins aren't quite long enough?).
Im not brave enough to use too much force but if held tightly
whilst clicking on the read/write icons the radio offers up its info
and accepts programming data, in my case the Wales repeaters and PMR
data set.
Thanks for the help, couldnt have done it without the reams of info on this site.

RIK

Among other things, Chirp will allow alpha tags, actually one extra charachter.

Possibly have a bad load of the BF software. What is the exact error message that you get?

Hi

I am impressed with this group two very fast answers, Thanks

The error is 8020 run time error, or some time failed to read the radio.

I have tried the VIP build and unless i missed something it appears to just run from an exe without installation ?. It also does the same thing.

As I said the funny things is chirp works just fine.

Yep. There's a FAQ for that!

Some have been successful and twisting and pulling on the pins to get them to stick out a little further. I personally would be a little uncomfortable with this method.

Others have taken a sharp blade and trimmed back the plastic to make the pins stick out further. This I might try if I had the problem.

The third possibility would be to purchase another cable. I got one from DealExtreme.com for $6.60 USD that works fine. EverBuying.com has one for $5.82 USD but I've never bought anything from them before.

Good luck & 73,
Jim KC9HI

I have been trying to get it to run on my Win7 machine with no luck. I have down loaded the drivers as recommended, restarted my machine, and attempted to update the driver by picking the newly installed driver. Here is my problem...where is it? I have searched my computer, looked in the drivers folders and have not been able to find any driver named Winvista7prolific.etc driver. How or where do I go to specify that driver? Thanks!!!!

Ahh, thats an Ooops from me, for some reason did not think it did but after your comment another look and found it so thanks.

I would still like to get the BF5R software to run if possible but now it is not such a big issue, just hate to be beaten by software..

The runtime error refers to the comm port. Check to be sure that the port selected in Communication is the same as is set for the USB. The BF software always goes back to Com1.... does not save the settings.

Hi

I am impressed with this group two very fast answers, Thanks

The error is 8020 run time error, or some time failed to read the radio.

I have tried the VIP build and unless i missed something it appears to just run from an exe without installation ?. It also does the same thing.

As I said the funny things is chirp works just fine.

Chirp it reads the radio fine but when using the BF5R software it throws up a run time error when trying to read the radio.

Hi Thanks

I find it strange it does not save settings, but sorry i did check and set it to the correct comm port every time i tried the download. It all looks like it cannot see the comm port and if chirp works the driver is ok, and i cannot see any other settings for the BF software.

I think i will leave this until tomorrow now as i have a sore head now after battling this and it is 01:00 here..

Thanks for everyones help and hope fully with more good suggestions i may get it sorted tomorrow.

Topic: 5649 Message: 5660

I've downloaded just about every copy of the Baofeng software that I've been able to locate. I believe the Baofeng software is written in Visual BASIC 6. Some of the archives include the VB6 runtimes software, others do not. If you archive is <2 Meg is probably doesn't.

Look for a Baofeng software package that is >2 Meg and contains a BF5R_CPS.CAB file. That .CAB file will have all the VB6 files in it. I'm using "UV_5R_P 20120425.rar" from the group files area. As far as I know it is also the latest version available. Give it a try.

Hopefully this will get you working. If it works, then you should be able to switch to others like the VIP version if you wish.

Let us know.

Tygre,

Sorry, I go detained. Right now I am having trouble understanding what you are telling me.

With CHIRP you can "Download From Radio" which takes the channels that are in your UV-5R already and sends them to CHIRP. This must be done first.

Or you can "Upload To Radio" which takes the CHIRP 'spreadsheet' and sends it to you UV-5R.

What COM port number are you using? How did you determine what it is? I believe John suggested using FindCommPort.exe and that sounds like a good idea to me.

Are you able to download from radio? The RX/TX LED on the front of the UV-5R should flash red. If you can download, do the rows and columns appear to represent the channels that are programmed in your radio. If they do, save them now.

Are you able up upload to radio? The RX/TX LED on the front of the UV-5R should flash green.

Jim

5662. A B C D keys

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-07 00:39:29 UTC
From: Dave Schultheis
Topic: 5662 Message: 5662

Hello friends,

I'm posting this mostly so that it can be found in the archives when someone asks.

While the "0 through 9," "star" and "pound" keys are labeled, the A B C D keys on the UV-5R are not labeled, but those four keys can be used if needed.

The four keys labeled "Menu," "(up arrow)," "(down arrow)," and "Exit" will give you A, C, B, D, in that order. Note that they are out of order.

Also note that the sidetone (the tone you hear in the radio speaker) does not match the audio which is sent over the air.

Also, I think that some UV-5R radios have the up and down arrows reversed, so that the top row of keys would be A B C D, but I cannot confirm that.

John,

I think I figured out "niggle" but can't quite deal with "natter" thinking it might be "another"?

Anyway, although I did it until I found out you shouldn't, this type of battery should not be left in use when on charge. I believe that for a while (1/2 -3/4 of a charge cycle) might be OK. Read up on this battery at http://batteryuniversity.com/. Quite good information.

Have fun with this toy, last night I was able to hit a repeater 65.5 miles away using a flexible "Slim Jim".

Do you remember back to when Spiro Agnew talked about "nattering nabobs of negativism?"

I think that a "natter" repeater could be defined as what I call a "signal generator" repeater: no matter when you turn the radio on, someone is talking about something. Talk, talk, talk.

Not that there's anything wrong with talk, talk, talk!

My 8 y.o boys were each given a UV-5R for their birthday. I liked it so much I ordered another from Amazon AND I ordered the programming cable (I opted for the $10 version rather than the $2 version figuring there was a quality difference).

I hadn't found this group, but I guess I got the "right" cable.

The only point of my post is to thank everyone here for the great contributions. I was able to quickly find the drivers needed for Win 7 x64, download the latest daily build, and connect the radio in under 10 minutes (while on vacation in northern Minnesota with only a cell connection to the internet no less :-).

Again, many thanks to all who contribute here and made it so easy for me.

I'm off to keep reading and play with the CHIRP software a bit more!

5678. problem programming a channel

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-07 15:19:24 UTC
From: Gary Metzler
Topic: 5678 Message: 5678

Hi All,

Gary kn4ox here. I seem to be having a problem manually programming a repeater into a channel. I don't have a cable. I am following the instructions in Buddy's eyes free manual. I am blind so I can't read the display. When I first enter the channel number I get the receive freq message. I hit the exit key and then the scan button. This is where things fall apart. It doesn't say transmit freq. For some reason I think the unit switches to the uhf band. I am programming a vhf freq. What can I be doing wrong? Any help would be most appreciated. Thanks and 73,

5679. Study strategy for new hams and the UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-07 15:22:24 UTC
From: tenorman1952
Topic: 5679 Message: 5679

Please indulge me here, this is long-winded but all related to the UV-5R.

I saw a "follow up" video on youtube by a ham, user name "philip". In his UV-3R review he begain by saying, "The UV-3R is a cheap piece of crap, but sometimes that's just what you need." And he went into the uses to which he had put the little UV-3R. In a follow up video he told of asking a ham wannabe what was his barrier to entry into ham radio, what was holding him back. The fellow answered cost of all it took to get on the air. Philip held up his little UV-3R and said, "I can get you into ham radio for 80 bucks," and went on to explain to the fellow that he could take a local "ham cram" for $30, which included materials and license test fee. "So how much is this radio?" And the guy just couldn't grasp that the radio was only $50. Then he finally got it. The little UV-3R could be an entry radio for a new ham.

I thought about some Scouts my club had given some study materials, a class or two, and station tour, letting them talk to others during the Jamboree On The Air day. Philip's video really got to me... some of those young men had the fire in their eyes, wanted to be hams but the cost of entry was too high.

The UV-5R, which is a better radio, by far, can now be bought via eBay for about $49 with free shipping. I'd gladly give them links to free study guides online, practice tests, etc. And if the young men couldn't pay the $14 for the test session I'd do that out of my own pocket. So "We can get you into ham radio for 63 bucks!"

That is one barrier removed from the equation. A few days behind a lawn mower and these kids could earn enough for a UV-5R.

Then point them to the question pool on the ARRL site. There are others, and I have a list of places for practice tests, too, QRZ, eHam, etc. Also a url to a Powerpoint used by a large club in my area they use for their ham crams.

Now back to the question pool. Above each question is a parenthesis by the question number that gives the correct answer, A, B, C, or D, for that question. So do this... print the question pool, but do not look at the answers yet. Use a black marker to black out all of the incorrect answers, leaving only the correct answer visible. This way, when you study, you study only the correct answers. The others answers are distractors, and may not even be related to the question at all. Don't learn them!!! Then when you take the test only the correct answer will look familiar to you. Seriously, print, black out, then study. This really works.

And as I suggested here earlier to our fellow UV-5R member and new General licensee, don't study only for the Tech. If you can pass the Tech, you can pass the General, so once you get to where you are passing the Tech practice exams by 90% or more, begin study for the General. When you are passing the General practice exams by 90% you are ready for the real TESTS (PLURAL!!!).

Now, back to your regular programming.

73,
Paul - AE5JU

Topic: 5680 Message: 5680

Hello Gentlemen ---- I have been enjoying reading the Group forum here and learning as much as possible while I wait for my two radios. I have also been catching what YouTube videos I can find on manual programming and uses as well.

See if I have the setup for cable programming right here....

I have a cable on order which comes with a CD. My computer system is running Win7-64. I am hoping the cable is of the proper vintage that takes the stock Windows USB chip driver and uses it properly. But if not, then I need to revert the chip driver to the OLDER driver but any incompatibility between the USB chip driver and the chip should show by not appearing in the 'Device Manager' Com Port line up, right?

Sounds like the best software to go with, that is the most functional and error free, is CHIRP (the daily published version). If that is the case, I won't even bother with the BF5R software program which I have already looked at (pretty simple and basic). Looks like all those that program via PC, prefer the CHIRP software.

Well, again, nice to meet everyone here and am looking forward to getting "the goodies" and getting set up. I work both ham repeaters and listen a lot to public service frequencies (fire, police, marine, etc.) Any comments or suggestions much appreciated.

Cheers/Regars,

Bob K6WL

Hi George,

I think the group gets many people who are just starting out. The UV5R is a small device and expectations are that it should be very easy to program. After all, isn't everything meant to be "easy"? And it's so very small!

Many are probably not use to reading a "technical" manual, where things must be followed exactly, to the letter, or the device will fail to initialize. So, they have to go through a "learning curve" about the radio, reading for accuracy, and following directions to the letter. It is certainly frustrating for them, and can lead to the same for those that try and give advice. The manual that comes with the radio is of little help, probably causing as much confusion as instructing. Without the group file area, a helpful web page, and the advice of this group, many might just give up.

What I like about this "hobby" is the diversity of skills possessed. The technical side of things have never been a problem for me, but I often find myself weak on "people skills". The other day I tuned into a Midwest HF SSB net... conditions abounded that should have made it a total mess and utter chaos, but it wasn't. Net control took the chaos and somehow controlled it, making for a pleasurable event; I would have fallen apart under conditions like those.... not skilled in that area.

So, for those of us taking this "journey", lets relax and have some fun. It's not "instant pudding" easy, but it is worth the effort on both sides. The learning, the helping, the doing.

Jimmie, K9JFK

Let's have some fun today!

Gary,

So after you press the 'SCAN' key are you entering menu 27 and saving again? If not, that is the step you are missing. After the second save the HT will then respond "transmit frequency".

This version has been out for a while now. I have 2 myself. New 3600 Mah lithium Ion battery which makes the radio a little taller and easier to grip. Nothing different in firmware than what I saw when I first thought about this radio some months ago. I use CHIRP software personally. It is really the best for this radio. The FM broadcast is there but there are no "memories" available for storage. It's on-the-fly programming as you listen, nothing committed to memory.

Bob,
My advice would be to find another use for the CD that comes with the cable. Don't even take it out of the sleeve unless you are going to use it for a drink coaster. ;-)

Seriously, there is no sense in risking polluting your computer with the wrong driver and then have to go through the frustration of removing it to get the correct one installed. You might as well use known working drivers from the start.

So download and install the driver software from the files area of this group. Use the guide in the "Programming cable and drivers" folder of the files area to determine which driver file it the right one for your situation. The website listed on the 'home' page of this group is also a good resource for driver information.

An incompatible driver WILL show up in Device Manager. It will have a yellow triangle with an '!' centered in it letting you know that something is wrong. I covered how to recover from this in more detail in a post a few days ago. Let me know if you can't find it and I will locate it and provide you with the message number. Lunch is over and I have to get back to work or I would look it up and share it with you now. Sorry.

Hopefully you'll be good to go. If not, we are here to help you.

You can still get it with the standard battery. There are several "bundles" offered with the UV-5R. Some come with the USB cable, some come with an earpiece or handheld microphone, etc. The inclusion of the larger battery just happens to be one of the bundles offered by this seller.

Cheers,

RD

5698. New Arrival! - Update

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-07 17:53:59 UTC
From: John
Topic: 5698 Message: 5698

Was going to leave this until later, but here goes.

Decided to read my FT-7800 with Chirp as opposed to my normal software.

Worked fine, I then got rid of the *Out of Band* freqs. I.E. Air Band, exported to a CSV file, passed that to my laptop downstairs, loaded into Chirp, loaded into UV-5R, works a treat!!

Also did some tests with a local, G3WTO, via our 2 repeaters and simplex.

Both repeaters 59+, maybe the UHF one slightly better

Simplex was ok, John, G3WTO, reported me about 51/52, but with weak audio, he mentions on his UV-3R he fitted a Speaker/Mic and that sorted the low TX audio .

John is maybe 2.5 mls from me.

GB3AS (VHF) is about 10Mls

GB3CA (UHF) is about 7Mls

So now we have portable rig with the same channelling as my mobile!!

73' all and thanks for a great forum.

John ☐ G8CAU

PS

I have both the supplied UV-5R software and CHIRP working on my shack comp. Win XP(SP3) and on my laptop, W7 64Bit - 8Gb ram.

Without this forum, I'd have struggled with both. . . . .

73'

> the low TX audio?.

Make sure you have programmed the channels as WIDEBAND.

The UV-3R and UV-5R are Chinese LMR radios, not Japanese ham mobiles.

LMR radios are designed for the user to speak loudly into the radio
holding it closely to their mouth. This prevents the transmission of the
local noise, people off to the side, etc.

Japanese drivers are not allowed to hold a microphone near their mouth.
So they drive with it in their lap and talk to it instead of into it.
Therefore the mobile radios are much more sensitive and most hams
overload them.

73,

Geoff.

Hi Jim,

Thanks for the response. I save the channel twice but, the second time I enter the channel number it says destination freq. Also, somehow the band gets changed to uhf. I'm thinking of doing a reset and starting over.

Subject: [baofeng_uv5r] Re: problem programming a channel

Gary,

So after you press the 'SCAN' key are you entering menu 27 and saving again? If not, that is the step you are missing. After the second save the HT will then respond "transmit frequency".

Barry,
This has been discussed before. To the best of my knowledge, nobody has found a solution to the alarm feature. The Baofeng programming software has a setting to turn the alarm function off but it doesn't work. The best you can do is set Menu 32 to SITE so at least the alarm isn't transmitted over-the-air. Sorry.

hey there, New to HAM, taking my test next week. I picked up the UV-5R as my first radio. (BTW duplex is set to off so no accidents,lol.)
having a problem though and i am not smart enough to figure it out. Probably something simple.
I program a local weather station and worked fine at first. Now I can only hear it if I press the Monitor button. If I hit the Call button twice it comes in fine.
I have tried adjusting the squelch and can't see any difference in 0-9.
I also tried entering a FRS and same thing. When I transmit from my motorolla I can only hear it on the UV-5r if I press and hold monitor.
Seeing if I was missing something I was browsing the menu and while on certain menu items the broadcast would come through.

Welcome to amateur radio!

> I program a local weather station and worked fine at first. Now I can only
> hear it if I press the Monitor button.

If you have easy access to the Yahoo!groups page, please look for a recent message entitled "new users/primer on tone squelch."

You may have accidentally set either "R-DCS" or "R-CTCS" to something other than "OFF." This will make the radio require a sub-audible tone in order to send the sound through to the speaker, and the weather service does not use that type of signalling.

Solution: Be sure that Menu 10 and Menu 11 are set to "OFF."

Gary,
I just got home from work. I just loaded Buddy's guide into WordPad and manually programmed a channel.

I followed the guide step by step and I believe that I got tripped up in the same place you did. I went back and reread step 15 and step 16 and I know what I did wrong.

What I did, and hopefully you did the same thing, was once I heard 'China girl' say "memory channel" I thought I was done. But if you stop there, you don' get the 'real' transmit frequency programmed (you wind up with a simplex channel on the receive frequency).

What you must do after hearing "memory channel" is type the memory channel number again and then press [MENU] one more time. You should be rewarded by hearing 'China girl' proclaim "transmitting memory".

Let me know if that is it. If it isn't, then we can compare notes and try something else.

Good luck,
Jim KC9HI

Hi Jim,
Tune to the NOAA weather channel. Look at the display just to the left of the upper display. I'll bet you can see CT or DCS.

My guess is that you've accidentally changed Tone Mode in CHIRP to TSQL or possibly DTCS. On a receive only channel, more than 99.99% of the time Tone Mode should be set to (none).

You will need an external TNC and GPS- maybe some ideas here-

ok, my only concern is the adapters. I need a tnc, which either has a PC data port, ethernet or whatnot and that goes to a radio adn a gps reciever. My gps has a mini usb port, so i need an adapter from the tnc to mini usb and i need another one that goes from the tnc to the radio (in this case it would be the mic and speaker 3.5" jack and how ever big the mic port is on the uv5r)...correct?

Hello Gents ---
Wondering if a USA source of programming cables that are KNOWN to have the bona-fide, genuine USB chips in them is known??

Sure would appreciate a heads-up on this one if such a source exists.

Thanks/Regards -- Bob K6WL

Cables are not really a problem- just follow the solutions outlined in the files section. The problem has been solved- follow the instructions.

Here is the spkr/mic pinout-
3.5mm Plug
Sleeve- Mic ☐ (and PTT and Rx Data)
Ring- Mic +
Tip- +V

2.5mm Plug
Sleeve- Speaker ☐ (and PTT and Data Gnd)
Ring (Tx Data)
Tip- Speaker +

Connect Sleeve to Sleeve for PTT

Hi John --- yes, I am aware of the "work-arounds" on the cable scenario. I know we can make any cable work, given the right chip driver selection and install.

I was just hoping to have a cable that would be compatible with the real chip maker/Microsoft drivers that are the Windows defaults. Reason for me is that I have two other devices that use the same chip for USB serial programming and all have port memory and drop right in with the Windows chip drivers. Not a big deal, just a handy convenience.

Thanks again for the heads up! Cheers -- Bob K6WL

I have 2 USB-to-UV-5R/Kenwood programming cables, 1 USB-to-ICOM programming cable and 3 USB-to-DB9M serial port adapters. They all have the Prolific chipset and I swap between them at will. If I plug them in the same USB port of the PC, they are always given the same COM port number. Very convenient.

Windows 7 64-bit with Prolific v3.2.0.0 driver.

The main difference between the 2007 driver and the latest driver is probably the 'poison' that was added to cripple the new driver when used with the non-genuine copies.

Yo Jim --- I double checked all my existing usb-->DB9 cables and they are FTDI based. I also have a GRE radio which uses the same type of serial programming setup (custom cable) and the interface chip is FTDI also.

I use a few general purpose USB-->DB9 in my ham shack to connect up various radios and a GPS time standard. My shack computer is Win7-64 based. Have had no problems to date with compatibility.

Anyway, looks like there is an easy way to get rolling using whatever cable I get in my present order and add the appropriate chip driver to it. I can always play around later on once I get up and running and used to the UV-5R.

Sent: Tuesday, August 07, 2012 6:24 PM
To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Re: problem programming a channel

Gary,
I just got home from work. I just loaded Buddy's guide into WordPad and manually programmed a channel.

I followed the guide step by step and I believe that I got tripped up in the same place you did. I went back and reread step 15 and step 16 and I know what I did wrong.

What I did, and hopefully you did the same thing, was once I heard 'China girl' say "memory channel" I thought I was done. But if you stop there, you don' get the 'real' transmit frequency programmed (you wind up with a simplex channel on the receive frequency).

What you must do after hearing "memory channel" is type the memory channel number again and then press [MENU] one more time. You should be rewarded by hearing 'China girl' proclaim "transmitting memory".

Let me know if that is it. If it isn't, then we can compare notes and try something else.

Good luck,
Jim KC9HI

Gary,
Awesome!! Thanks for reporting your success. You made my day. And thank you, Buddy, for the guide.
73,
Jim KC9HI

Bill, I actually find the larger battery, which is 3600 mah vs the original smaller battery at 1800 mah, is tight, well balanced, and actually makes the radio easier to hold and operate. I've just purchased a second UV-5R and bought it with the larger battery included.

I'll keep the small battery that came with the first radio, keeping it charged and available as a spare.

For what it's worth, I sprung the princely sum of 2 bucks on a USB-to-RS232 cable similar to eBay item number 200790832428 It seems to work fine with my AMD Anthlon II 620 quad core running 64-bit Windows 7, even though there were warnings on the ad that the adapter doesn't always work with 64-bit 7 on "some computers". Your mileage may vary of course.
I already have a "fake" Prolific cable, and am the author of the Cables, Prolific PL2303 Drivers, and Windows 7.pdf guide in the Files section. Although my existing cable works fine, I figured 2 bucks to try the serial adapter route to have in my general computer accessories arsenal, (and if that works another $6 to 8 for a serial programming cable), was a worthwhile investment to have a spare way to skin the cat.
Some on this lively group have fervently suggested this non-Prolific chipset route as "the" solution to the counterfeit chips problem. I can only agree to a certain point. It is an option. But as long as all the counterfeit cables have not been relegated to the garbage dump or the steamroller wheels of the Patent & Copyright Police, the driver downgrade option will continue to be valuable.
Don't throw your existing cable away in frustration. Don't be afraid to buy a cable for fear of getting a counterfeit. While I do not condone the manufacturing of illegal knockoffs, getting stung by one is not the end of the world. The driver downgrade works.
 It just takes knowing where to look, and a little patience.

Perfect. Just get you a DB9F-to-Kenwood style programming cable on eBay for less than $8 and you'll be set. Search for 6-004A

I suggest that you (1) Visit the N9TAX.com website if you have not done so already. (2) View some of the YouTube videos for this antenna using "n9tax" in the search.

That done I'll attest that mine is quite weather proof where it needs to be but there are two points where extra attention might be taken if you are going to "niggle" (I just learned that word today) and that would be the top and bottom as the areas are exposed somewhat......electrical tape or heat shrink would do that.

My others thoughts.

We are looking at under $30 here including shipping for a QUALITY antenna that is really portable, flexible, stealth like. I built a "F" mast out of white pvc water pipe sched 40 that screws together and sets up in minutes, a couple of bungee cords and I can mount this 15 footer (mast and antenna) just about anywhere and be on the air in less than 5 minutes. RESIST the temptaion to enclose this antenna inside of or touching anything as it loves OPEN space.

My best performance to a repeater so far with the UV-5R and the N9TAX is 65.5 miles and the report was a very strong signal with good audio. The area may have had something to do with it as I was in West Chesterfield, NH and the repeater in Sommers, CT..... The CT River Valley may have helped narrow the signal a bit but one of the features of this unit is that it "hugs" the ground.

I hope that I have answered your questions if not change a few words around and we'll do it again..... I don't have any personal interest in N9TAX.com and only want to pass along my findings of this product.

John

Julian,

How is your new 5cm antenna so far?

I wonder how is the performance compared to this $9 5cm antenna.

Hi Paul,

Yep Spot on, FTB7800 by Bob.

Id read the 7800 via FTB7800, saved a .CSV file, but could not load that into Chirp . . . So read 7800 with Chirp, save as .CSV and it worked fine!! - Have to say, it was only after reading more about Chirp on here, I found out it would readmore than the UV-5R!!

Hi Bill.

The $9 5cm stubby antenna came yesterday - fast service by 409shop. I can confirm that it does work. However after repeated tests I find that it is 2-3dB down on the best of my BNC A-158 stubby antennas similar to the one in the eHam review you linked to but having a BNC connector. This 2-3dB is the difference between accesssing a distant repeater and not accessing it.

All 3 antennas have a very narrow SWR bandwidth. The $9 stubby had a best SWR of about 1.6:1 at 143MHz. The two BNC antennas had better than 1.5:1 SWR at 144 and 145.5MHz respectively. I have confirmed several times that the performance of HT antennas is affected as much by how good a match they are as by their length (excluding antennas that are dummy loads!)

I made several test transmissions transmitting using each of the stubbies and noting the dBm reading on my very useful Yaege counter / field strength meter. I also transmitted with another radio and put each of the stubbies on the Yaege and again noted the field strength. The results were consistent within +/- 1dB and clearly showed that the BNC stubby with the lowest SWR at 145.5MHz was the best of all though there was little to choose between the two BNC antennas. The $9 stubby was repeatedly seen to be 2 to 3dBm worse than the others.

I suspect that there could be quite a bit of difference between examples of the same antenna due to production tolerances. Because the tuning is so sharp an antenna does not have to be far off the frequency you are using to perform noticeably worse. You could be lucky and get one with the best SWR just where you want it and it would probably be a great performer.

I have seen stubby antennas with the best SWR as high as 158MHz (and I have seen some with no detectable frequency response at all!) I think the $9 HH-S518 is a good antenna, or at least a safer bet than other similar antennas at around the same price.

I tested the antennas at 433MHz as well. The $9 antenna was a better match (SWR 4.5:1) than either of my BNC stubbies and performed 10dB *better*. So if you use UHF than VHF the $9 antenna has a clear advantage.

Hope this all makes sense to someone.

Jim I really appreciate your patiernce and assistance to the group but I still am at my wits end. I have tried over and over per your instructions with no luck. One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

> > > > >
> > > > > This step may not be necessary but let's do it so that we both start in the same place. Plug in your USB programming cable. Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.
> > > > >
> > > > > With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.
> > > > >
> > > > > Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.

> > > > >
> > > > > Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!
> > > > >
> > > > > You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.
> > > > >
> > > > > That should be it. Good luck and have fun programming your UV-5R.

You can get the Byonics TT4 and their Kenwood HT cable. You will need a RS-232 Serial GPS.

Hi Julian,

Many thanks for your prompt reply. Just to confirm my understanding, your findings concludes that the HH-S518 antenna is better than A-138?

A-138, 5cm, 144/430Mhz
http://www.radiogearpro.com/main/product_info.php?products_id=627

HH-S518, 5cm, 145/435MHz
http://www.409shop.com/409shop_product.php?id=106518

Secondly, would the HH-S518 outperform the UV-3R+ stock dual band antenna too?

Alan

I would suggest that you stick with the standard PL-259 as perhaps in the future you may want to hook to a mobile or some such. I have a UHF/SMA female connector adapter that completes the transition to the UV-5R. Also available is a the same configuration but with a lighter cable between the connectors.

Subject: [baofeng_uv5r] Re: New Arrival!

What kind of connector(s) would I need to buy in order to connect it to my baofeng? I am thinking about the dual band slim jim with the 15 foot rg58 cable attached.

Thanks
Alan

>
> My others thoughts.
>
> We are looking at under $30 here including shipping for a QUALITY antenna that is really portable, flexible, stealth like. I built a "F" mast out of white pvc water pipe sched 40 that screws together and sets up in minutes, a couple of bungee cords and I can mount this 15 footer (mast and antenna) just about anywhere and be on the air in less than 5 minutes. RESIST the temptaion to enclose this antenna inside of or touching anything as it loves OPEN space.
>

> My best performance to a repeater so far with the UV-5R and the N9TAX is 65.5 miles and the report was a very strong signal with good audio. The area may have had something to do with it as I was in West Chesterfield, NH and the repeater in Sommers, CT..... The CT River Valley may have helped narrow the signal a bit but one of the features of this unit is that it "hugs" the ground.
>
> I hope that I have answered your questions if not change a few words around and we'll do it again..... I don't have any personal interest in N9TAX.com and only want to pass along my findings of this product.

On a $50 HT does it really matter? You are not DX'ing, and only in the most rare (if ever) circumstances would you use a yagi or beam antenna on a radio like this. Your S meter is your ear. If you can hear what they are saying, then it works.

Driver "install" packages don't give you a choice of where to install them to because installing a driver is not like other software. They go to live in the bowels of Windows somewhere and become part of an arsenal of drivers that Windows can call upon when it wants to associate a particular device with a software driver to run that device.
I'm fumbling a bit for terminology here, but you can think of it as two stages. When you do your driver install it adds it to the pool. When Windows does it's thing, it selects a driver to use. That's the part we need to hijack to get it to use 3.2.0.0 rather than a more "up to date" version, which Windows naturally figures must be better.
If you're not getting 3.2.0.0 as one of your available choices when you go to tell Windows which one to use, chances are good that the situation I outlined in message 5603 has occurred.
Fragments of old, partially installed and/or removed drivers are clogging up the pipes.
I have no association with this product, but it has helped many in your situation.
 Download Revo Uninstall Pro. Unregistered, it works 100% for (I think) 30 days. That's enough. Use it to completely flush your system of anything resembling "Prolific PL2303" drivers.
Then install 3.2.0.0. Then select it as per other instructions. Then celebrate.Ian

Jim I really appreciate your patiernce and assistance to the group but I still am at my wits end. I have tried over and over per your instructions with no luck. One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.

> > > > >

> > > > > With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.

> > > > >

> > > > > Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.

> > > > >

> > > > > Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!

> > > > >

> > > > > You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

George,
This is a worldwide group of Baofeng UV-5R owners, potential owners and enthusiasts. I'm not aware of any requirement for members to be amateur radio operators (although many are hams). So please don't base your reason for leaving on not being a ham. You ARE welcome here.

The HH-S518 is hands down better on UHF and about the same on VHF. But I have never tried a current production A-138 SMA F. The ones I compared with are BNC and were purchased a couple of years ago.

Julian, G4ILO

> --- In baofeng_uv5r@yahoogroups.com, "g4ilo" <julian.g4ilo@> wrote:
> >
> > Hi Bill.
> >
> > The $9 5cm stubby antenna came yesterday - fast service by 409shop. I can confirm that it does work. However after repeated tests I find that it is 2-3dB down on the best of my BNC A-158 stubby antennas similar to the one in the eHam review you linked to but having a BNC connector. This 2-3dB is the difference between accesssing a distant repeater and not accessing it.
> >
> > All 3 antennas have a very narrow SWR bandwidth. The $9 stubby had a best SWR of about 1.6:1 at 143MHz. The two BNC antennas had better than 1.5:1 SWR at 144 and 145.5MHz respectively. I have confirmed several times that the performance of HT antennas is affected as much by how good a match they are as by their length (excluding antennas that are dummy loads!)
> >
> > I made several test transmissions transmitting using each of the stubbies and noting the dBm reading on my very useful Yaege counter / field strength meter. I also transmitted

with another radio and put each of the stubbies on the Yaege and again noted the field strength. The results were consistent within +/- 1dB and clearly showed that the BNC stubby with the lowest SWR at 145.5MHz was the best of all though there was little to choose between the two BNC antennas. The $9 stubby was repeatedly seen to be 2 to 3dBm worse than the others.
> >
> > I suspect that there could be quite a bit of difference between examples of the same antenna due to production tolerances. Because the tuning is so sharp an antenna does not have to be far off the frequency you are using to perform noticeably worse. You could be lucky and get one with the best SWR just where you want it and it would probably be a great performer.
> >
> > I have seen stubby antennas with the best SWR as high as 158MHz (and I have seen some with no detectable frequency response at all!) I think the $9 HH-S518 is a good antenna, or at least a safer bet than other similar antennas at around the same price.
> >
> > I tested the antennas at 433MHz as well. The $9 antenna was a better match (SWR 4.5:1) than either of my BNC stubbies and performed 10dB *better*. So if you use UHF than VHF the $9 antenna has a clear advantage.

From: bradahj
Topic: 5763 Message: 5763

After programming the receive frequency for a repeater..... do I immediately go back in choosing the same frequency but this time setting the offset?

For example.

147.150 no offset (receive frequency)
147.150 +/- 600 (transmit frequency)

Also, I've read that it is possible to transmit on a police frequency if something is set wrong. Can someone point me to a link about this?

It depends on the type of connector that is on the end of the J-pole antenna.

The BNC is my "go to connector" at UHF low power, but if the antenna has a pl259, you need to go with that and an sma to so239 adapter for the radio. If there is a connector choice for the antenna, I'd go with BNC.

I think the '259 is ok at 2m, but not very good at 70cm. The BNC is good from audio to the 4GHZ range, as long as you stay below 200w, or so. Quick chart here....

http://highfields-arc.co.uk/constructors/info/connchart.htm

Now, I do currently use some Pl259 connectors at 440mhz in my fixed station, but the power level is 30 watts.

5768. Nagoya NA-771 Antenna H*LL

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-08 18:36:26 UTC
From: toledohamradio
Topic: 5682 Message: 5768

It would appear that the Nagoya NA-771 I bought is a useless 'fake' from China without any coverage of the 2 meter ham band. When the tiny stock antenna is better than one 3x as long, that's pretty bad.

Did anybody else get stuck with one of these useless fake Nagoya NA-771?

I'm tempted to simply cut the thing in half and see if it actually improves my reception on 2m, or whack the entire whip off at the base and simply solder a 19" long piece of spring wire to what's left of the connector base?

Suggestions from the group of how to salvage a bad deal into someting useful?

Regards,
John

I do not think you can manually program receive only. If you do not input a Tx frequency, the radio will revert to simplex and Tx on the Rx frequency. Get the software.

From: Louis Fiore
Topic: 5771 Message: 5771

Hi All

I have two UV-5Rs. In one case, the volume control does not go to zero. In other words, I cannot bring the sound output to zero. In the second case, it operates as I believe it should. Has anyone had this problem?

73, Lou W2LTF

The voice prompt will say "Transmitting Memory" and "Receiving Memory" (on a different channel).

Also, my English voice has not Chinese accent and the volume does turn all the way down.

Might I have the updated firmware?

5775. receive mute control

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-08 19:44:08 UTC
From: unalias2
Topic: 5775 Message: 5775

I recently notice that my UV-5r has a very brief delay before the mute re-enables, resulting in a very brief squawk, or snap due to the open squelch. Now this is very brief, and on low volume levels hardly noticable, but very noticable on higher volume levels. On my ICOMs this doesn't exist, so I either never noticed it or I changed something while programming this thing. After spending some time examining the settings and all the documentation I could find I can't find any way to change the timeout for the mute. This certainly isn't a show stopper, but it would be nice to clean it up a little. Anyone know of a setting that can be altered to shorten the period between end of transmission and when the mute kicks back in?

I had issues too getting an earlier version of the prolific driver on my windows 7.2 computer. It insisted on installing the latest version. I was finally successful when I removed the latest driver, disconnected my cable to the router so that it could not access the Internet, then follow the programming cable installation procedure.

There is no squelch delay adjustment. Rx tones provide some level of squelch tail suppression. If your repeater transmits tone, then try enabling Rx (Decode) tone. If your repeater does not transmit tone (the usual case) not much can be done. You might try Tail Noise Clear and Pass Repeater noise settings.

Gary,

Yes and No.

When in frequency mode, either VFO can be set to VHF or UHF. Just press the BAND key to toggle to the desired band. VHF is active if the display starts with a 1. UHF is active if the display starts with a 4. If you can't see the display, then type in a frequency to determine the band. If you want VHF then key in a VHF frequency. If band is set to UHF, the voice prompt will say 'cancel' when the 6th digit is entered. If you enter all 6 digits without hearing 'cancel' then the band is set to VHF. Follow me?

All manual programming must be done from VFO A (the upper display).

Manually programming using Buddy's guide is exactly the same for either band. The only difference is the frequency entered.

Jim KC9HI

Just picked up a couple of these for $5.00 plus shipping...they say they are for Kenwood, but the plug is correct.

http://www.pryme.com/index.php?l=product_detail&p=2188

Seem to work well.

Rudy,
All the numbered BLUE functions are just menu shortcuts. Press the [MENU] key and then the [8_BEEP] key takes you to the BEEP menu (or menu 8).

Press and hold the [* SCAN] key to begin scanning. Press and hold the [#_(key symbol)] key to toggle the keyboard lock on and off.

Got it. Thanks. Now if I can just get the memory channel stuff down, I'll be OK.

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Re: problem programming a channel

Gary,

Yes and No.

When in frequency mode, either VFO can be set to VHF or UHF. Just press the BAND key to toggle to the desired band. VHF is active if the display starts with a 1. UHF is active if the display starts with a 4. If you can't see the display, then type in a frequency to determine the band. If you want VHF then key in a VHF frequency. If band is set to UHF, the voice prompt will say 'cancel' when the 6th digit is entered. If you enter all 6 digits without hearing 'cancel' then the band is set to VHF. Follow me?

All manual programming must be done from VFO A (the upper display).

Manually programming using Buddy's guide is exactly the same for either band. The only difference is the frequency entered.

5792. Baofeng antennas

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: stanwhite_snr
Topic: 5792 Message: 5792

Hi,

My findings, updated...

Antenna supplied with UV-3R. No moulded identification on the antenna, only a label around the inside of the SMA connector. Quite good on 70cms, pretty bad on 2 metres.

Antenna supplied with UV-5R, looks the same as the 3R antenna, but there are moulded markings on the outside of the antenna, including the name "Baofeng". Reasonable on 2 metres and 70cms. Not quite as good on 70cms as the 3R antenna, but good, none the less.

Test setup:

A home brew "handheld" made from folded aluminium, with an antenna connector on top, fed by RG58 co-ax, which had a number of large ferrite "beads" on it close to the "handheld" to take the cable out of the equation.

Other antennas worked really bad, unless a tight grip was made on the "handheld".

A homebrew 1/2 wave 2 metre antenna gave very good VSWR, as did a commercial Yaesu 1/2 wave for 70cms.

My conclusions are that if you want a very good antenna on the Baofeng, go for something half wave, or, for something small, the UV-5R antenna supplied is a pretty good match, and a reasonable performer. The 3R antenna is no good at all on 2M.

I also had the opportunity to investigate the Nagoya 771 antennas with the silver writing on the label. They were none too clever either. About the same as those with blue lettering. (They are slightly shorter than the "blue" ones).

HTH,

73 de Stan, G4EGH.

Topic: 5547 Message: 5798

Jim,
I let my computer install the latest driver close to 10 times this evening so I could experiment 'fixing' it. Here is what I want you to do.

1 Remove the USB programming cable from your PC if it is plugged in
2 Create a folder on you PC to work in.
3 Download the file "http://www.ifamilysoftware.com/Drivers/USBDriverFiles.zip to the folder created in step 1
4 Extract USBDriverFiles.zip into the folder created in step 1.
5 Go to "Control Panel|Uninstall a program" and uninstall anything that has to do with Prolific drivers (this may require a reboot).
5 Go to the folder you created in step 1 and execute PL2303DRemover.exe
6 Now execute PL2303_Prolific_Vista_332102.exe
7 Unplug ethernet cable from PC
8 Plug in the USB Programming cable
(wait for the "Device driver software installed successfully" balloon popup to appear-it will also display the assigned Com port)
9 Plug ethernet cable back into PC
10 Done - now report back to me that YOU won!

Good luck,
Jim KC9HI

>
> Jim I really appreciate your patiernce and assistance to the group but I still am at my wits end. I have tried over and over per your instructions with no luck. One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

> > > > > > This step may not be necessary but let's do it so that we both start in the same place. Plug in your USB programming cable. Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.
> > > > > >
> > > > > > With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.
> > > > > >
> > > > > > Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.
> > > > > >
> > > > > > Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!
> > > > > >
> > > > > > You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

Thanks, John. I use his software for my FT-2800m and FT-1802M. I'll try these with CHIRP.

73,
Paul - AE5JU

Guys,

Anyone know anything about this mobile antenna?
see:- Item #260734355303 on EBay.

Attracted to it as it has a SMA Female termination

73' - John - G8CAU

Paul - Chirp will read your FT-2800M, not sure about the FT-1802M though, its not listed in my version.
(CHIRP daily-20120730)

I got a NA-771 a week or so ago and was very disappointed with its performance. I thought it might be a fake but it appears that it isn't. Mine had a silver Nagoya hologram label on the plastic sleeve and came from 409shop.

Is there any reason other than performance to show yours is a fake?

The 'meter' only tells you when the squelch is being opened. This appears to be common on the new generation of SDR-based radios. The last SDR-based radio I tested, the Waccom WUV-6R, shows the same behavior.

To find out if your radio is actually capable of showing some level of signal strength, you can do the following experiment:

1. Find an empty frequency
2. Use the monitor function to open up the squelch (on the UV-5R, press and hold the LED flashlight button)
3. Look at the 'S-meter'.

You will see the meter jump to full deflection, even when you take off the antenna.

Current models from Puxing, Quansheng and Wouxun are built around conventional technology, and don't suffer from the many flaws related to SDR. They're much more expensive though.

> that means that UV-5R doesn't have a IF freq ??

Correct. It also does not have an audio processing system such as discriminator on receive, or an FM or phase modulator on transmit.

The signal is decoded by DSP (digital signal processing). The receiver algorithm looks for a modulated signal near where it is supposed to find one and decodes it. No signal, no decoding. It also prevents tuning problems with slightly off frequency signals.

That's why you can't open the radio and take raw audio out. All you get is "cooked" audio (PL removed, any signal shaping compensated for, etc).

On the way out, it's the same thing, you can only take regular audio and inject it in before processing, you can't go directly to the modulator and add digital carriers, PL tones, etc.

The audio is processed down to a frequency difference which directly applied to the transmitter frequency.

I think there are registers in the chips which can be programmed with an offset to get the radio to transmit on the correct frequency and to look for signals in the right place. AFAIK they are set once at the factory and cannot be changed by the user.

All of the similar radios use the same chipset, the Bafoeng UV-3R and it's variants (VeroTelecom), the UV-5R, the TYT radios that it is a modification of, and the Wuxoun. I believe there are Chinese made Yaseu radios that use it too.

Geoff.

I purchased one (from another eBay vendor, RadioGearPro) last fall and have been very satisfied with it. While the base is somewhat small, the magnet holds well. The antenna is approx. 13 in. long; while I have not done any SWR, etc. measurements, I've been very successful using it with a local UHF repeater that I can barely hit with the stock antenna (on my Wouxun KG-UV2D) due to the location and low antenna height of the repeater, and also with a Kenwood mobile configured as a cross-band repeater with an antenna about 25 ft. above the ground, from several miles away.

I note that RadioGearPro's price w/shipping for a new antenna is only slightly more than the price shown in the eBay listing below. Their listing indicates that they accept returns, but you'd presumably have to pay shipping back to Hong Kong.

Just a suggestion- I prefer BNC for antenna cable termination and use an SMA Female to BNC Female adapter on the radio. With the SMA Female on the cable you must turn either the radio or the cable to connect to the radio. Also, the BNC adapter provides better cable support where it attaches to the radio.

LOL...I did win the battle...but still fighting the war. I was able to get the driver to install finally. The trick was totaly uninstalling the current driver using Revo Uninstall. Once I did that I was able to install the "old" driver and everything went well, so that was the battle. Then I tried to connect to the radio using Chirp (which I do not use on my laptop, use the software that came with the cable)and wasn't able to talk to it. Keep getting "Radio did not ack first command". Got to be late so I gave up but will play around with it some more tonight. I may install the mfg. software and see if that works first before I start playing with Chirp again. If I remember I couldn't get Chirp to work on my XP laptop either.

> >
> > Jim I really appreciate your patiernce and assistance to the group but I still am at my wits end. I have tried over and over per your instructions with no luck. One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with

the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

Got mine last night and started to play. Programmed it in 'frequency mode' including channel. When I switched to channel mode and entered the channel number, some 70 cm freq came up. But in VFO mode it worked great...no problems at all.

Anyone have suggestions? Will try Chirp over next few days.

The LCR comes loaded with some test frequencies. These should be eliminted before you go too far.

Also it is a good idea to download the original programming to Chirp or Baofeng software from the radio. This will at least get you back to the "Factory Condition" if you ever want to.

John

The UV3 is an SDR rig, and that has a the most sensible s-meter
I have ever seen on a Chinese rig.

It's also the cheapest rig on the plant ;-)

Hi Julian,
I got a NA-771 about 2 weeks ago and I am not sure if it is a fake or not.(blue writing) I am disappointed with the results, no better than the standard one supplied with the Baofeng UV-5r.
Julian can you let me have your email address as the one I tried was sent back to me. I have something I would like to discuss with you.

I got a NA-771 a week or so ago and was very disappointed with its performance. I thought it might be a fake but it appears that it isn't. Mine had a silver Nagoya hologram label on the plastic sleeve and came from 409shop.

Is there any reason other than performance to show yours is a fake?

Julian, G4ILO

5819. Antenna Observations UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-09 15:47:24 UTC
From: apollomaker
Topic: 5819 Message: 5819

Hello All ---
Well, I am into my third day of experiments with my UV-5, and did notice something yesterday during a short QSO on two meters. I had probably talked a total of about 45 to 60 seconds (actual transmit time) when I caught a weak smell of something getting hot.

I had been running high power, and I touched the bottom of the antenna (where the two meter loading transformer is) and it was quite warm!! Yikes. Wonder if anyone else is experiencing the same observation?

I guess that is one way to get bandwidth (make it real lossy) but out of all the HT antennas I have used, this is the first dual bander I have ever been able to warm up. This speaks poorly about the efficiency of the antenna on two meters. Not only is it short (under a quarter wave) but very lossy as well. The antenna seems to be fine on UHF and works well there.

Leads me to know I have to find something better overall. Then I see all the claims of fake antennas -- arrrghh!!! Maybe a good Diamond or Comet is the answer --- what say out there? Has anyone found a good compromise antenna?

Comments and suggestions please!!! Thanks --- Bob K6WL

Hold down the #(lock) key. It's not like a Nokia phone, where you hit
menu and then the # to unlock. Just hold down the # for a couple seconds.

From China with Blue stamping, orange & clear vinyl package with 'hologram';
performance is the same or even less than the stock antenna on 2m VHF, except only the 88-108 FM music band it is slightly better than stock.

Tuned in a distant NOAA WX radio channel, moved radio just to where squelch barely breaks, and then tried the 771 - no improvement in that part of the VHF band at all. Likewise, not able to hit local 2m repeaters any better with blue 771 than stock.

Hi. I am new to this group. My UV-5R is just 2 days old. I like this little radio, the price is really amazing. I tryed to install the PC software on my Win7 Laptop. Everything set up without error. I use the USB cable that comes with the radio. When I am trying to connect the radio to the PC, I get an error message that the connection is not possible. I have checked all the settings, such as COM port, drivers, and i checked the device manager. I tryed to install the PC Software and driver on a PC with WIN XP. So far without success. Should i set the radio in a certain mode?

Hey all,

I tried everything you guys have here and still can't get my radio to talk to the computer. I have several computers ranging from 9 years old, to brand new: Vista 64bit, Win7 (brand new), XP, etc. While I finally got the driver to be "working properly", and the software (all kinds) to recognize my device manager com port changes, the radios will not communicate with the computers with any of the three cables I have here: Baofeng, or the TYT 9000 cable, or the TYT UV5 cables with any of the 5 radios I have.

The easiest driver setup was on my Vista64. Win7 was a pain with the way it looks for the latest driver.

After 6 hours on the project yesterday, and lots of comments from family on why I was STILL at the computer, I've given up. If I'm missing something, I wish someone could show it to me but all the basic stuff about com ports, software, drivers...all covered. In fact, I double, triple and quadruple checked everything many times over (ie the 6 hours sitting here yesterday).

Yes, I disconnected from the net to setup the driver and read the PDF's, and read many other posts, other sites, read reviews, read other programming problems and solutions from here to the UK on the web. I read all about pushing the connector in, wiggling it, unplugging it and re-plugging it, putting it on mode A, putting the radio on memory mode, etc etc. ad nauseum. The driver is set up and it's the one you guys put here. Thank you. It works too. But the radio won't talk to the computer.

Just an FYI. I know you've tried all of the cables. I worked for a while with some great assistance from some of the great folks on this group. I finally got mine to read and write to the radio (I kept getting errors) by just plugging it in all the way. The first time, I thought the plug was all the way in, it wasn't quite there. It took just a little more effort and it seated properly. Then it worked. After that first time, it hasn't been difficult at all to plug it in and it works perfectly. But that was my experience.

John:

In fact, most VHF/UHF FM rigs don't measure signal level, they measure IF saturation (quieting). This is why most of them show full scale at relatively low levels (some as low as 10 uv or less). The exceptions in the Ham world are the multi-mode rigs that also do modes other than FM which often have more realistic S-Meters.

John,

Thank you for the info.

My shipment arrived just moments ago from mega409shop, and the packaging and description are exactly the same as what you describe.

Oddly enough, my UV5R's have not arrived yet. Soon as they do, I'll give the Nagoya antennas a good testing.

Should my Nagoya's be duds, I will be letting my vendor know about not only my findings, but also the findings and commentary of the UV5R Yahoo Group concerning these antennas.

Hopefully, when they read the flow of disatisfaction, maybe they will solve the problem and make things right.

My guess is the UV5R "meter" is tied directly to the squelch.
The monitor funtion shows full scale with zero signal signal.

Howdy All -----
Still waiting for my programming cable, but tinkering a bit with both CHIRP and Baofeng programming environments. I noticed the version of the BF software I have been looking at has a menu and frequency mode page where you can set up and store the settings (or most of them) along with a particular channel programming content and save them together.

Have I missed the same thing in CHIRP or am I overlooking it? Or maybe it might just be good to have both programs set up on the same computer and use the one that suits my need at the time. Has anyone done this with success? Seems like it should work since only one of the progams should be connected to your USB port at any time. And the radio should read and write to both I would think.

Comments? Any experience with this kind of arrangement? I have not loaded any drivers yet since I am still waiting for my USB programming cable --

Thanks for any comments or pointers. Cheers --- Bob K6WL

I have purchased a few NA-771s and they seem to be hit or miss, 1 I purchased is about the same performance as yours, and 2 work as well as my diamond rh-771. I don't think you got a fake, just one that doesn't work. Nagoya's quality control seems to be seriously lacking

Bob,
CHIRP does have a Settings tab that has a few settings that are equivalent to the Baofeng Optional Features page. I totally overlooked it until somebody in the group mentioned it. It's on the left under the Memories tab.

Anyway, I have and use them both.

Has anyone done this with success? Seems like it should work since only one of the progams should be connected to your USB port at any time. And the radio should read and write to both I would think.

Hold down the #(lock) key. It's not like a Nokia phone, where you hit
menu and then the # to unlock. Just hold down the # for a couple seconds.

moin juergen,

ich habe vor einigen monaten wegen pc-verbindungsproblemen ein geræt der ersten serie nach HK zurueckgesandt (409shop). das kostete als maxibrief ca 4□ (nur geræt, ohne zubehør) und ich habe ein funktionierendes nach weiteren vier wochen wiederbekommen, dass sofort ohne probleme mit dem pc kommunizierte. dies nur mal so als letzter versuch nebenher.

73
--

hi juergen,

i sent back a radio of the first series to HK (409shop) because of the same connection problems. took me another 4□ (only sent the rig, no case, batt., etc) and another four weeks later i received a new one that worked well communicating to the pc without any reinstalling\changes of software. just a quick if anything else failes.

Thw war has been won!! Thank you to everyone who helped guide me through the driver/Win7 issue et al. I down loaded the latest build of Chirp this evening and after a couple of minor issues...success!

--- In baofeng_uv5r@yahoogroups.com, "jim_k2qb" <k2qb@...> wrote:
>
> LOL...I did win the battle...but still fighting the war. I was able to get the driver to install finally. The trick was totaly uninstalling the current driver using Revo Uninstall. Once I did that I was able to install the "old" driver and everything went well, so that was the battle. Then I tried to connect to the radio using Chirp (which I do not use on my laptop, use the software that came with the cable)and wasn't able to talk to it. Keep getting "Radio did not ack first command". Got to be late so I gave up but will play around with it some more tonight. I may install the mfg. software and see if that works first before I start playing with Chirp again. If I remember I couldn't get Chirp to work on my XP laptop either.

my wits end. I have tried over and over per your instructions with no luck. One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

was saved and double-click on it. Give it permission to change you computer's settings and
agree to the license agreement. Wait for it to get installed. It doesn't create and folders
because it is only installing drivers.
> > > > > > > >
> > > > > > > > Now plug your USB programming cable back in. You will probably get a popup
saying that the driver did not install properly (thanks to Windows 7 over-riding your
driver installation and getting the latest for you). You can verify that this happened by
looking at Device Manager again and you should see the dreaded yellow triangle with the
exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.
> > > > > > > >
> > > > > > > > Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this
time select "Update Driver Software...". Now click on "Browse my computer for driver
software". This next step is the really important step. Click on "Let me pick from a list
of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version:

3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!
> > > > > > > >
> > > > > > > > > You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

I ordered the "HT saver" with mine. I have 2 "Slim Jim's". I custom ordered the "HT Saver" with my choice of cable ends. It was well worth it.

Go for PL-259 if you plan to ever have a 10/6/2/70cm base setup as that is what many radios have. Otherwise BNC for quick change between Slim and vehicle.

Is there a preference here? BNC vs. PL-259........

Why might I choose one of these over the other?

Thanks.

Hi Bob,

as others have already said, you can have both installed on the same computer, you can even run both at the same time, just don't try reading and writing to the radio at the same time.

And as you have noticed, there are differences. There are a bunch of settings in the BaoFeng software that you can't edit with Chirp, for example, per-channel settings like PTT ID, Busy Lock Out, and DTMF codes. The BaoFeng software also lets you control the frequency mode settings where Chirp does not.

Chirp does do a few things that the BaoFeng software doesn't, like changing the power on message and the allowed frequency range. Chirp will also let you use all 7 characters of the channel names where the BaoFeng software only does the first 6.

Chirp will however, remember all the settings form the radio that it doesn't understand and preserve them, so it's perfectly safe to go back and forth (i.e.: read an image from the radio, edit, write back to the radio, change to the other program and repeat). Chirp can also look up your local repeaters and import/export your channel memories to other radio types.

There are a few people working on figuring out where all the additional settings live in memory and updating Chirp to be able to edit them, so I expect the Chirp program to improve over time. (If I get the time in the next few months, and someone hasn't beaten me to it, I intend to help out there.)

Chirp is also cross platform, so will work on a Mac or Linux box and has a somewhat less clunky UI (though it still has its quirks).

Peter

Hi Peter -----
Thanks for the inputs and it sounds like a setup with both programs available will provide for the best flexibility. Sounds good.
It looks like the future can provide for some great upside features to the CHIRP software especially given its cross-platform capability.

Regards --- Bob K6WL

Agreed, but don't use a one-piece SO-239 to SMA adapter. That puts a lot of weight and strain on the tiny SMA on the radio.

Instead use a "pigtail" or "HT Saver" such as these:

http://www.2wayelectronix.com/RG-174-HT-saver-patch-adapter-cable-3-foot-174-PATCH.htm

http://www.universal-radio.com/catalog/hamantht/4454.html

Paul

http://www.universal-radio.com/catalog/hamantht/4513.html (This would require a double female adapter)

Then I tried to connect to the radio using Chirp (which I do not use on my laptop, use the software that came with the cable)and wasn't able to talk to it. Keep getting "Radio did not ack first command". Got to be late so I gave up but will play around with it some more tonight. I may install the mfg. software and see if that works first before I start playing with Chirp again. If I remember I couldn't get Chirp to work on my XP laptop either.

One thing that is odd is when I install the new driver it does not give me a choice of where to install it nor does it indicate where it installs it. Also, when I go to update the driver and select browse my computer, it brings up a list of all the various devices which I can then click on and it will show a list of available drivers. If I select USB-Serial converter, the only driver it lists is the original Prolific driver I assume because it does not list it with the version number as you state. Even if I uninstall the driver, plug in the cable and then stop the driver installation and try to install the correct driver I get the same results. Like I said it works on my laptop so this is more or less a war between me and my desktop to see who wins...hi hi

> > > > > > > >

> > > > > > > > This step may not be necessary but let's do it so that we both start in the same place. Plug in your USB programming cable. Now launch Device Manager and open up "Ports (COM & LPT)" so that you can see the "Prolific USB-to-Serial Comm Port (COMx)" entry. Right click on it and select "Uninstall" and then click [OK]. Unplug the USB programming cable.

> > > > > > > >

> > > > > > > > With Windows Explorer, browse to where the driver file that you downloaded was saved and double-click on it. Give it permission to change you computer's settings and agree to the license agreement. Wait for it to get installed. It doesn't create and folders because it is only installing drivers.

> > > > > > > >

> > > > > > > > Now plug your USB programming cable back in. You will probably get a popup saying that the driver did not install properly (thanks to Windows 7 over-riding your driver installation and getting the latest for you). You can verify that this happened by looking at Device Manager again and you should see the dreaded yellow triangle with the exclamation point right in front of the "Prolific USB-to-Serial Comm Port (COMx)" entry.

> > > > > > > >

> > > > > > > > Now right-click on "Prolific USB-to-Serial Comm Port (COMx)" again but this time select "Update Driver Software...". Now click on "Browse my computer for driver software". This next step is the really important step. Click on "Let me pick from a list of device drivers on my computer". Choose the "Prolific USB-to-Serial Comm Port Version: 3.2.0.0 [7/31/2007]" selection and then click [Next]. The next window should proclaim "Windows has successfully updated your driver software" and now you can click [Close]. What you really did is "down"-dated your driver!

> > > > > > > >

> > > > > > > > You should be done, but to be sure take another look at Device Manager. The yellow triangle should be gone. Look at "USB-to-Serial Comm Port (COMx)" and note the COM port number (the number in place of the 'x' that I show). Hopefully it is COM8 or less. Now double-click "USB-to-Serial Comm Port (COMx)" and select the driver tab. The driver version will be "3.2.0.0" if you were successful.

This might be *Old News*

There is a UK dealer for the UV-5R and other goodies.

Web Site:- www.sinotel.co.uk <http://www.sinotel.co.uk>

They offer a Next Day delivery, order by phone, order by email. Prices about as good as HK dealers.

I bought my UV-5R from them. Sinotel is run by a ham, from a large warehouse in Warwickshire.

I found their service second to none!

I have NO connection to this firm, apart from being a very satisfied customer . . . . .

Regards All

Do Diamond or Comet make antennas with an SMA-F connector?

Probably best to find a nice SMA-F to BNC adapter, then you can choose from the whole range of BNC antennas. That's what I'm currently using.

Exactly like mine.

> performance is the same or even less than the stock antenna on 2m VHF, except only the 88-108 FM music band it is slightly better than stock.

I didn't try a comparison with the Baofeng antenna but the 771 performed no better than a black/silver label 701 half the length.

It's starting to look as if Nagoya antennas are best avoided.

I see they have a very nice looking radio the TYT-UVF9 but what is really surprising is that prices are no more than they are on Ebay.

Yes, that's what surprised me Julian.
Another local, M6MOS ordered the UV5R yesterday after considering the TYT-UVF9.
After a hospital visit this PM, I'm off to see another local too, he's considering the UV5R and will decide after seeing and having a play with mine . . .

Hope you're keeping well

Sinotel do also sell via ebay, for example, see item 261072569648, but I have bought two UV-5R from them directly, and a couple of accessories. They don't have a very wide range of products, but the service is very good, (less than 48 hours delivery both times) and the headline prices are actually cheaper than their ebay items(although they add P&P)

regards, Martyn M3MDY

Well it looks like I have the new UV5R programmed with Chirp, but it REQUIRES a tone squelch which render the radio useless. I also checked the program and put a 2m repeater in with 0.6- offset. On the radio it comes up with a minus 5 MHz offset. What's going on?

I have both the BF and CHIRP intalled on my Lenovo B575 lapper. I use the BF for my 3R's and CHIRP for my 5R - HOWEVER - CHIRP has so far failed to store the PL tones for the CTCSS. It lets me enter them, but as soon as I scroll the screen up and down the tone entries have all returned to default.

Nobody has commented on this so far.

Define compromise. Sounds more like some people are just hell bent on not spending more than $5 on an antenna. Perhaps it's the "but I only spent $XX on the whole radio!" mindset, in that if one only spends $50 on the radio, then it's just an absurd idea to spend $25 on a decent antenna..."that's half the cost of the whole radio!!"

I picked up a Pryme RD-98 for mine from my local HRO, cost $25 (oh, wait..I guess $30 after you factor in the SMA to BNC adapter). I have ZERO issues with it, it works AWESOME, and if there are any issues with it, I take it back to HRO and get a different one without spending days ripping my hair out trying to determine if I have a real or fake antenna.

I'd be willing to bet several people here have close to that $25 in buying several different $5 antennas (+shipping), from ebay, 409, or similar trying to find one that works.

Yes, I think that's what most of us do.

CHIRP can't set a lot of rig-specific functions (though it can do a few.)

I had bought a Nagoya NA-701 (SMA-Male) for my UV-3R and it has performed just fine, adding several miles to the range I got with the Baofeng antenna. Yes, I got out on the highway and tested it, marking locations with GPS, miles to the repeater, etc.

Naturally, when I bought the UV-5R I also ordered a NA-701 (SMA-Female) to go with it, and it has performed well, too. I haven't tested miles to the repeaters yet, but I'm getting good signal reports.

The NA-701s seem to be a good compromise between length and performance.

I've got one of their older ones with the short whip that works fairly well...not near as well as the Pryme 98, but it's a lot easier to manage inside a small car.

Joe
as others have mentioned, you can have both the baofeng and Chirp software loaded; they coexist just fine. However, when I was initially setting up the chirp software on my laptop I found it was acting skittish. the Baeofeng software worked fine, but chirp was being a pain. My solution was just to move the baeofeng and chirp to a second spare laptop and both loaded fine and both run fine, I use them every day. My guess is that Windows on my first laptop might just be a bit contaminated. I can also attest to what the others are saying, both software packages can be loaded and run and both have their strengths and weaknesses.
Good luck
Charlie

and I love it! Yeh, hand programming is a bother I haven't learned yet, but with a computer to do it, that may take a while. I downloaded factory settings into factory program first, made some detail changes, uploaded to radio then downloaded into Chirp (that gets the little details that Chirp assumes out of the way). Then loaded the same freq file I use in my Yaesu's & UV-3R and it all works great. Just needed to tweak the different details a bit, then saved it. Great battery life, hits the required repeaters cleanly, etc. Not as small as the 3R but a lot nicer.

5890. Chirp

Which version of Chirp is being used for the UV-5R? I am using version 0.2.2 and it only finds 3R under Baofeng.

Also, Is there anything I have to do to have the software recognize the radio is connected. I have it set to the correct com port.

I've been using the UV-5R at work and every time I transmit I make all the other radios squeal (like when you hold a microphone next to a speaker) and when I end my transmission I still get the SSSHHHHHH (squelch noise).

I don't know how to fix this or if it can be fixed....was thinking of downloading chirp to see if there are any options that are not available in the Baofeng software that might fix the problem.

Oh, the frequency that we are using is Simplex (460.200) with DPL 205N.

Any suggestions would be greatly appreciated. Thanks!

Can you explain that again? Are you sure it isn't audio feedback?

I'm not sure what you are doing or hearing?

What if all the other radios are turned off?

Feedback! You are transmitting on the same freq that the other radios are receiving. You radio hear the noise from the other radios and retransmits it. That cycle continues until you release the PTT.

I suspect it is because the Motorola radios have very poor audio and the owners crank up the volume so they can hear. Since your LCR has good audio, you leave the volume low and don't cause feedback when they transmit. Tell them to turn down their volume controls. Maybe your mic is a bit hot- try a piece of tape over the mic hole.

More than likely the UV5R is transmitting a "birdie" that falls on the same Motorola receive frequency. I assume the Motos don't have tone or digital squelch.

Mike,

I have 2 UV-5R's and I have tried to cause the issue that you are having and can not. The Roger Beep was the only thing that seemed a possibility that I could try to create.

Another possibility exists and that is that the mic switch is hanging and/or not making good contact. In the old days we would see this on CB mics used in trucks and farm tractors as they got worn and dirty and the solution was to attempt to clean the contacts or replace the mic. In the real old, old days relays would hang up giving much the same result.

So the follow up question would be, are you using a external speaker/mic or the built in? We have had issues with the mic/spkr connector on the side perhaps something is afftecting the button also?

If your UV-5R works well otherwise outside of your work setting then perhaps it's more of an issue with Motorola vs the outside world of & having to do with the PL codes..... just a guess there.

Please keep us informed.

Does it work better if you squeeze it toward the radio? If so, try trimming a bit off the bottom surface to make the pins a little longer.

From: bewleyd
Topic: 5910 Message: 5910

It gets excellent reviews on eHam. Of course it does require an adapter because it only comes in BNC and SMA Male versions.

Thanks,
D

I have to say I've had no problems with the unit since I got it on Thursday.I've been able to program it right up, copy and paste values in from webpages, the standard configuration files in Chirp, etc. Not sure what the problem is, but my unit seems to work pretty well. Perhaps there's some variation in cables or connectors inside the rig?

5914. stock antenna and other impressions

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-11 01:22:59 UTC
From: wf3h
Topic: 5908 Message: 5914

Using the stock antenna, it's difficult to hit a repeater that I can usually hit with my Yaesu FT50RD. I have the $3.79 antenna on order and hopefully will report next weekend about results. Had to open the squelch to about 3 to get good reception of USCG sector Delaware Bay (about 100km from me near Philadelphia). Does have a bit of intermod from local public services but not too bad.

Also have to day a big thanks to everyone on the group. Amazing group of people; very knowledgeable about this radio in particular and electronics and programming in general. The Chirp program works like a charm, especially the automatic offset for 2m and 70cm.

Rig is a good deal and I'll have a chance to try it out on coming trips to the Grand Canyon, Phoenix and San Antonio.

Mike,

One other thought. Does this noise occur after a clean conversation to the Motorolas or is the exchange bad also? I am trying to get to the actual timing of the event. Sometimes there is a problems with a good connect vs a clean disconnect.

Subject: Re: [baofeng_uv5r] Re: Problems, Problems, Problems!!!

Mike,

I have 2 UV-5R's and I have tried to cause the issue that you are having and can not. The Roger Beep was the only thing that seemed a possibility that I could try to create.

Another possibility exists and that is that the mic switch is hanging and/or not making good contact. In the old days we would see this on CB mics used in trucks and farm tractors as they got worn and dirty and the solution was to attempt to clean the contacts or replace the mic. In the real old, old days relays would hang up giving much the same result.

So the follow up question would be, are you using a external speaker/mic or the built in? We have had issues with the mic/spkr connector on the side perhaps something is afftecting the button also?

If your UV-5R works well otherwise outside of your work setting then perhaps it's more of an issue with Motorola vs the outside world of & having to do with the PL codes..... just a guess there.

Please keep us informed.

I couldn't agree more. When I was in the business nothing irked me more that not knowing if what you suggested actually solved the problem. I wasn't trying to build up my ego just really wanted to know so that I could pass it on as needed.

The other thing that needs to be said..... please give as much detail as you can. Sometimes what one figures is not important is the clue one needs to sole the issue.

Today and once of twice since April my cable was not seated correctly in the computer and I got an error message. I think that some of these cable have used up the tolerances usually allowed for such things. You need to make sure that the connectors are seated well both in the radio and the comptuer or things just don't work.

Thanks to everyone for the advice. I have checked with an oscilloscope the signals between the programming cable and handheld radio. I've made a cable that fits between the radio and the output of the programming cable. The PC software and cable is working properly. The radio will not respond at all. To the jacks i can connect a headset microphone properly. In my opinion the problem ist the radio.

I have to second that.
I had trouble finding it also and I'm definitely not new to computers.

Most OSS projects list a direct link to the latest nightly build, tarball release on the download page. I bit of trac/wiki integration trick, once put in place it's automatic.

As far as I know, it is not possible to store FM station into memory EXCEPT you are an UV-5 shipped with the very Unew firmware version....
Can't tell more,don't know more :)

Mike,
It may be worth looking at menu# 5 (Wide/Narrow)
If you're using your 5R with *commercial* h/t's - they will most likly
be narrow band and set to *NBFM* have a look at #5 and see what its set to, if set wide,
pop it onto NAR and try with your work mates, see if you still get the feedback . . .

If all that fails, sorry! - Im lost!

My UV-5R came from them, fast service at reasonable cost. They replied to my question in a few days. Their phone number goes to a general switchboard so you have to wait to be connected to the company. Saved about a pound (1.50 USD) buying direct compared to their eBay shop but at least eBay/Paypal didn't get anything.

> also.

Sorry, but the development/daily builds are not supposed to be used by regular folks. You (collective) are the only community that uses the daily build as a matter of course. I don't want people running the daily builds unless they have a specific reason to. In fact, they didn't use to be listed on the site at all, rather only posted to the mailing list and accessible as a result of fixing a bug.

I want them to be a little obscure and harder to find than the main version. I spend a lot of my time explaining to folks that *are* running the daily builds that things break there from time to time and that they should be running the official build unless there is a reason to run the daily. I could spend my time answering those questions over and over again (you folks know how *that* goes), or I could spend my time working on real issues.

The solution here is not to make it easier to find the dailies for folks that don't know how to scroll down on a page. The solution is to snap an official 0.3.0 release with the UV5R support in it. That's a little overdue at this point anyway. I have a few bugs I need to fix and some general pre-release stuff to work out before I do. The summer is a busy time for me, but I'll get to it.

Thanks for your patience.

When you start to up or down load in Chirp, there's a pop-up menu showing the available ports. (The UV-5R cable isn't at the Bluetooth-modem port.)

On my system the UV-5R cable is listed as:
/dev/cu.PL2303-0000105D

If you're not sure, disconnect the cable and check the list of ports in Chirp. Connect the cable and check again. The new item is the one you want.

it only gives me 2 options.. neither one works ... it get the same options with or with out it plugged in. i tried 2 different cables, different radios and nothing.. i took the cable and radios to work and on a PC everything works..

these are the options..

/dev/cu.Bluetooth-Modem
/dev/cu.Bluetooth-PDA-Sync

Topic: 5943 Message: 5943

I ordered my UV-5R on 8/1 in yellow w/both 1800 and 3600 MAH batteries. The mailman delivered it about two hours ago. Very good first impressions. I connected it to my 64 bit Win 7 computer After installing the 64 bit V3200 driver software and changing the Com port from 9 to 2 it was able to download the configuration data from the radio.

I did have problems however using Chirp uploading the frequencies. It would download the almost empty database from the radio but would time out when I attempted to upload data. I connected it to my Win XP netbook and everything went smoothly.

I've mounted a Nagoya NA-701 antenna and given that I'm working at city's edge in a valley with metal roof the receive sensitivity is more than acceptable.

I've learned a great deal reading in this group and truly appreciate the good information provided. I've got a ton to learn yet and will also try to share any new things I pick up.

Kaba,
As far as we know the [3]+[power on] is the firmware version. I don't think anybody has figured out what the [6]+[power on] readout really indicates. The [6]+[power on] message can easily be changed. What does the HT display when doing a [3]+[power on]?

It shows BFB251. I was looking at e-bay seller Nicheone listing a UV-5. He listed it as "latest Firmwre Version BFB5 251, 1203151 V5".

There does seem to be some progression on the data presented by pressing the 6 key on start up. Perhaps nothing more than manufacturing date using the Chinese calendar??

[6] + [power on] could be the Julian date which converts to April 29th.

Ok, inspired by these messages I tried holding each of the other buttons during startup. No other apparent functions, except: the MON, Up, Down, and Exit buttons.

When holding those buttons during power on, the display reads "COPING" and the TX light blinks every few seconds as long as you hold the button. Any clue what's going on? Is this perhaps a radio to radio clone mode? (over the air? or over a radio to radio cable?) Anyone with two of these things care to do some more investigating?

Peter

FWIW, my best guess on [6]+[power on] is manufacture date, mine reads 1204171 VER 05, which I interpret as April 17, 2012, the trailing 1 is probably a manufacturing line # or perhaps a shift #. The VER 05 is probably a hardware revision #, with [3]+[power on] being the firmware revision #.

The receive performance of my new uv-5r was very ordinary to say the least, even on fm band. While packing it away a bit of fluff dropped into the SMA aerial connector, as i dug it out the radio burst into life. An unfurled paper clip worked brilliantly pressed against the pin in the SMA connector. When the aerial was sliced open the cap marked 3 joining the center pin of the SMA to the coil was not joined. An easy fix and now the aerial has that trick custom look

Interesting observation Peter. I was a little reluctant to randomly hold down various keys while powering on because my scanner will reset to original default configuration and erase memory if certain key combinations are pressed during power on.

Perhaps the key combinations you suggest are a way to do a quick QC functional test in the factory with pinging a factory test bed.

I have read that some owners had several frequencies programmed into memory on receipt. Mine only had one memory channel programmed and I believe that was 136.000 if I recall correctly.

My (6)+ Power On combination only produced a 5 digit number 120612 Ver 5. Could the sixth digit perhaps be work shift?

That's what we used to think back in April. But that was ruled out for several reasons.

Just search the group with "1203" and you'll see that units received in July still have a [6]+[power on] display of 1203151 VER-05. This is the same as the UV-5R that I ordered in mid March. I thought back then that the number 1203151 translated to 15 March 2012 with an extra 1 tacked to the end.

UV-5R units received in July with [3]+[power on] firmware Ver BFB251 (which currently appears to be the latest) can also be found with the [6]+[power on] display of 1203151 VER-05. It's hard to imagine that these units with the latest firmware were manufactured in March.

There appears to be 4 firmware versions that have been seen since the beginning of this group. Versions BFB230, BFB231, BFB238, BFB251. Back in June, Emiel PA2EM, was compiling a chart of 3 key and 6 key data [see message 2631]. According to his chart and assuming 1204171 was 17 April 2012, then all but version BFB230 would have been in production on the same day. Highly unlikely.

If this is the date of manufacture, there are too few manufacturing days. Only 1 day in April and no manufacturing days that I could find from 1204171 to 120651 [should that be 1206051?]. Also, what company would be building units in June if they are still selling inventory from March and clearly also made units in April? This isn't just old inventory because this would be 'new' firmware with 'old' dates.

So like I said earlier, I originally thought that this was manufacture date as well. I honestly think that is what it was intended to be. But I am currently convinced now that is it anything but the manufacture date. And don't forget, it is easily changed by the end user, so whatever its meaning was intended to be, it is no longer reliable.

Does it have a clone function? If so, then yes, if not then, no. I
expect those older radios are too simple to have such a function.

It sounds like the driver installation didn't work.

I installed the driver from:
<http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio>

I then ran his test script at the bottom of the above page in the OS-X terminal window.
$ kextstat -b nl.bjaelectronics.driver.PL2303
(The $ is the prompt, don't copy it.)

It will return something similar to:
Index Refs Address Size Wired Name (Version) <Linked Against>
136 0 0xffffff7f825b4000 0xb000 0xb000 nl.bjaelectronics.driver.PL2303 (1.0.0d1) <85 32 5
4 3>

The important part is: nl.bjaelectronics.driver.PL2303

If you don't get that result, install the driver again. Otherwise, try restarting the computer with the cable already plugged in and any other voodoo tricks you know.

Might you have a Windows virtual machine installed on your Mac.? If so, you have to make sure the virtual machine is configured to let OS-X capture the USB port rather than Windows.

Chris,

I think you will find this number is simply version information for the configuration image loaded at the factory. It may vary between different production test stations in the same factory. To test the radio, some sort of configuration image is needed to check if a PC to radio configuration transfer works. The number itself is likely to be of little interest to anyone but the factory QC folks and only then if some sort of problem was discovered in it.

RS discontinued support for amateur products shortly after this
was released and that was the end of it. Right now, I cant get
the updated 2.1 firmware for my PRO-106/197 off their website from
the links for either unit. RS support has gone down the tubes...

They could have upgraded the firmware and forgot to change the radio's date. It could also be a "Run or Batch Number". If things are changed the manufacturing process or if "mods" are implemented, the run number is changed. Run or batch numbers don't normally change with firmware revisions or the date the product was manufactured.

OK, I thought I had the radio working right but when I scan, I get nothing but static when it attempts to stop and read a channel. I go outside and the radio will just scan past the same channel. Following countless pages of directions, reading the files in here, I just can't seem to pick up anything. I do live on a very large hill with 40 mile views so I should be able to pick up something but everything is just static.

Does anyone offer a service to program a radio for my 6 or 7 needed frequencies? I don't have the time nor the patience really to figure this out. The giant brush fires now burning around us makes it more important then ever to follow the FD radios. Yet I can't even get a peep when locked in to it.

And also, what is a good but economical home roof mount antenna?

I have no clue what this means but here is what I do have. I have wireless high-speed that comes in off a small tower in the 5. something range. That is 1.1 miles away and only for Internet. The nearest cell tower is 10 miles. The nearest town is 4 miles. I basically sit on top of a large hill. I followed the directions on the one web site. Don't really know if the drivers are downloaded correctly or not. I guess they are. I have minimal experience with computers and zero with any type of radio equipment like this.

John thank you for the offer and let me answer your questions. I have no
clue if they are simplex or repeater. Here are the freq's I need. I have no
idea if I am even in the correct ballpark with anything I have attempted to
do. I just loaded manually the freq's and attempted to save them and then
scan thru them which doesn't seem to do much of anything. They won't save. The
freq bands are very close together out here it looks like and I can't even
get a peep from any of them. I would gladly mail this out with return postage
if someone could set it correctly.

Just a left field suggestion but if your need is to monitor local Public Safety channels for fires etc; try looking at your local Craig's List for someone who has a scanner already programmed locally.

I'm in a major metro area and I run 3 scanners to keep up.
1 on fire dispatch. 1 doing conventional other then FD.
1 APCO-25 scanner for the local public safety stuff.
Most times, all 3 are talking at once!

That leaves my LCR free for my echolink node.

I wanted something small and mobile to toss in the car if need be. Since I already have this I just need to get it working. Or sell it and find me a scanner that can be taken mobile.

Chris,

Is there a NOAA weather radio transmitter in your area. They are on 24/7 program one of them first. You will then know you are programming the channels correctly.

There only 7 frequencies.

162.400
162.425
162.450
162.475
162.500
162.525
162.550

Go to frequency mode and enter each frequency one at a time until you hear one. Make note of it and then repeat the process for the rest (you'll want to use the strongest sounding transmitter in the event that you hear more than 1).

Then program that frequency using one of the several guides available in the group. I'm recommend Buddy's 'eyes-free' guide.

Jim KC9HI

>
> OK, I thought I had the radio working right but when I scan, I get nothing but static when it attempts to stop and read a channel. I go outside and the radio will just scan past the same channel. Following countless pages of directions, reading the files in here, I just can't seem to pick up anything. I do live on a very large hill with 40 mile views so I should be able to pick up something but everything is just static.
>
> Does anyone offer a service to program a radio for my 6 or 7 needed frequencies? I don't have the time nor the patience really to figure this out. The giant brush fires now burning around us makes it more important then ever to follow the FD radios. Yet I can't even get a peep when locked in to it.

OK, Those are all repeaters. I assume you only want to listen since you are probably not an authorized user.
The Frequency column is your Receive frequency and you do not need to program tone since you are not transmitting.
There are ten Frequencies listed so we need to program ten channels. I don't have a UV-5R handy so this is from memory but should work. Hopefully someone will offer corrections or better ideas if something is wrong in the following procedure.
Go to A display
1-Menu 1 0 Menu OFF Menu (use arrows to select OFF)
2-Menu 1 1 Menu OFF Menu

3-Menu 2 8 Menu 001 Menu (Enter oo1 at keypad- clears channel 1 memory)
4-Input 154.34 using keypad
5-Menu 2 7 001 Menu Enter oo1 at keypad- saves channel 1)
You should be able to listen to Parker Fire Dispatch now on Ch 1.
Now enter remaining frequencies same way following step 3-5 but change 001 to 002 etc to add new channels.

If this does not work, I would be happy to program it for you.

I strongly recommend you get a programming cable and download and learn to use Chirp from danplanet.com if you are serious about programming the UV-5R.

It turns programming from a chore to a joy. The cable will cost less than shipping to and from NM and the software is free.

The folks here can help you walk through it.

It sounds like you are fighting two separate issues, programming and reception. It's much easier to troubleshoot if you can isolate the independent variables.

Turn on the radio into "Frequency Mode" (aka VFO). Enter the frequency of the NOAA weather channel into channel A. Then enter Parker Fire County 154.340 by entering 1 5 4 3 4 0 into channel B (don't worry about PL tones, you aren't allowed to transmit on these frequencies anyway). If you can hear NOAA, you are doing everything right.

If you can hear NOAA but do not hear the fire dept, there are a number of possible reasons why. First, they may not be busy. Keep listening for a call. Second, the repeater may be out of range for you. Third, the reception at your QTH may be poor due to the metal roof or a variety of reasons. There are more potential issues but if you can hear on NOAA you can probably hear on 154, so I assume your radio works.

You can also try listening to two different public service frequencies turning on dual standby mode "TDR" (menu option 7). Try the PD on 155.565 and the FD on 154.340. This will give you a better chance of hearing chatter.

Make sure everything is working before you try to program it by hand. I still recommend using the computer to program it. Then you can give stations Alpha tags (names, such as PkrCoFD)

Good luck,
-Brad

Topic: 5989 Message: 5989

Because it is not possible to change the R/T CTCSS in the memory mode, is there a way to quickly copy a frequency of a memory channel to the VFO mode so that I can use menu options 11 (R-CTCSS) and 13 (T-CTCSS)?

And in the original Baofeng UV-5R program, is it possible to program the R-CTCSS and T-CTCSS separately? In version 2, the T-CTCSS changes to "Off" after I have entered a frequency in the field without a R-CTCSS frequency... Both seem to be locked to eachother...

Thanks in advance for your ideas and answers.

Regards,

Francina

John,
Good memory. It looks spot on to me. One thing I learned from Buddy is that you can just press 0 (the zero key) to set menu 10 and 11 to OFF. That can save a bunch of arrow button pushing if the menu was set to something in the middle of it's range.

So the CHIRP stuff will work with the USB cable I hope? I would not mind getting a roof antenna. I get the Dallas/Fort Worth NOAA clear as day when the antenna is near the cast iron bathtub or the cast iron toilet tank. I can't get anything it seems that might be 4 miles away. But I would guess the DFW weather transmitter is farther away, say 28 miles.

Chris,
There is Frequency Mode (aka VFO) and there is Channel Mode (aka MR). You toggle between the modes with the [VFO/MR] key. The UV-5R will tell you which mode you have selected if you have Menu 14 set to ON (or ENG depending on the firmware).

When in Frequency Mode there are two bands, VHF and UHF. You toggle between the bands by pressing the {BAND] key. If the display starts with a 1, VHF is selected. If the display starts with a 4, UHF is selected. You just type in the frequency (without the .) to listen to it without committing it to a channel.

When in Channel Mode all the UV-5R will display is programmed channels. The channel number is to the right of the frequency display in small digits. You can move through the programmed channels with the arrow keys. You can also go to a programmed channel by keying in it's channel number. Thus keying in 1 0 7 will jump to channel 107 if it has been programmed with a frequency.

You enter frequencies in Frequency Mode and save them to channels to be later recalled and listened to in Channel Mode. Follow John's instructions a few posts ago. They couldn't be written any simpler. [Looking at them again, I do see a minor clarification. The example says to key in 154.34 but what John meant was 154340. You can't type in a . and I'm pretty sure you must enter all 6 digits.] Use the weather radio frequency for practice. So in place of the frequency in John's guide, key in 162550 (or the NWS frequency you said that you could hear) and save it to channel 1.

Keep trying until you can go to Channel Mode and listen to the weather radio on channel 1. Once you are successful, do it again for channel 2. Once you are confident you have the channel programming mastered, then you can start programming channels with the frequencies that you want to listen to.

Also note that it may take some patience to hear something. I'm currently scanning nearly 50 channels and radio traffic is really light right now.

Good luck,
Jim KC9HI

Chris,
There was a missing Menu key press in step 5. Hopefully that is what is tripping you up. Try this...

Before you start you must be in Frequency Mode.

You must also have the upper display selected (press the [A/B] key until the little black triangle is to the left of the upper frequency display. All programming must be done in the upper display.

Also make sure you have the VHF band selected.

Then follow John's guide. [I'm repeating it again here with the correction in step 5]

1-Menu 1 0 Menu OFF Menu (use arrows to select OFF)
2-Menu 1 1 Menu OFF Menu
3-Menu 2 8 Menu 001 Menu (Enter oo1 at keypad- clears channel 1 memory)
4-Input 154340 using keypad
5-Menu 2 7 Menu 001 Menu (Enter oo1 at keypad- saves channel 1)

Good luck,
Jim KC9HI

Go back and read message 5996. I'll even help you get there.

http://groups.yahoo.com/group/baofeng_uv5r/message/5996

The first paragraph tells you how to switch between Frequency Mode and Channel Mode.

The third paragraph tells you how to get around in Channel Mode.

If you really saved 6 channels, you should be able to switch to Channel Mode and manually 'step' through them one at a time with the arrow keys.

Once you've successfully done that I want you to list them here. Something like...

CH1 154.340
CH2 xxx.xxx
...
CH6 xxx.xxx

See you in a little bit (fingers crossed).

Good luck,
Jim KC9HI

ok. I didn't know I had to switch to channel modes

channel 1 154.325 parker fire
2 162.550 DFW weather
3 155.425 SPD
4 155.600 wpd

I have some more to go. One thing i am finding is that I might load the true freq and have it round off when saved.

Good. You're getting somewhere!

If you're within 500Hz of the carrier you'll be fine but you shouldn't HAVE to round off. The radio has 2.5 kHz steps. If you want exact without using Chirp, program for 2.5 kHz off and step it up.

Example:
Program 145.8625 MHz
First, make sure Menu 1 is set to 2.5 kHz.
Next, enter 145865.
Next, hit the down arrow.
You'll see the baby "5" on the display.

Then just go through the programming steps as normal.

Let us know what's going on with your Chirp install. Were you able to download and install the -installer.exe?

-Brad

Chris,
You're awesome! Pat yourself on the back!

Don't forget that there is a channel 0 [zero] LOL

If you want to scan you will have to delete channel 2. There is no way to lockout a channel without software. Since this channel broadcasts 24/7 the scanning would stop on this channel and never resume.

When in Channel Mode you can press and hold the [*/SCAN] key until the UV-5R responds "scanning begin" and then release. It will scan until you press a key on the keypad or turn the HT off.

I have CHIRP downloaded somewhere on here but no idea what to do with it because what is told will happen in the instructions, doesn't appear for me.

Win XP

I hit the start tab and I see chirp under recent activity along with RegHunter.

Do I plug in the USB cable with the radio on or off? This is where I get confused and quickly

Go to menu 1 "step" You can use the arrow keys to change the step resoution down to 2.5 khz. I think some versions go lower. this will help the rounding off. You only get 3 digits unless you program through software. While you are there check menu "0" and set your squelch accordingly.

Hope this helps.

Andy

The first thing you have to do is read from the UV-5R.

Do you know what comm port the cable has been assigned from XP? You'll need to know.

Plug one end of the cable into the computer and plug the other end into the UV-5R. Turn the UV-5R on.

Click on "Radio" then from the drop down menu click "Download from Radio"

A little "Radio" window will appear. You will have to supply info to the three boxes.

Port: {hopefully CHIRP will detect the port and show it as a choice}
Vendor: Baofeng
Model: UV-5R

Now press 'OK'

CHIRP should read the data from your UV-5R. If it does, save the downloaded information to a file before you do anything else.

That's the attitude that tells me the cable probably ISN'T snapped in.

The driver for Win7 and Vista are the same. Sounds like you've got other problems.

People will help here, but you need to have the right attitude and follow instructions.

Try Downloading the radio image file.

Plug the cable into the USB port and radio, then start Chirp.

Radio->Download from Radio

A dialog box will pop up and hopefully Chirp will detect your Comm Port.

If it doesn't get it on the first try, keep trying every Comm Port in the drop down box.

If it works, you'll see a file with the stations you programmed by hand in a spreadsheet type window. First, save the downloaded file as a *.img file in a convenient directory.

Then simply edit the fields. Then, hit Upload to Radio. Follow the examples on Miklor.com.

An idea to help receive thru the metal roof once the frequencies are programed. With so many metal buildings going up a passive repeater works great. Put a quarter wave on top of the roof and a quarter wave in the ceiling. Connect the two with coax. It works both ways. You can use your HT in the building to talk outside and visa versa. - Jerry WA5KZA

Dogidude,

The folks (1,000's) on this group are trying to help newbies (and oldbies) enjoy their new toy. It is a great little radio at a cheap price and because of that it attracts some folks that do not understand some of the terminology that is used here or especially in the User Manual(?).

The person that has the problem(s) needs to explain in as much detail as possible what's going on so that we can narrow our answers to your problems. Several of us may read the question/problem different and it's possible that you will get conflicting answers.
Sorry about that.

Present the problem again, with a smile and somebody will work it through with you.

This radio covers a multitude of services, the manual borders on a short comedy, the software both the Baofeng and Chirp require a certain degree of competence to use it, the cables may have a problem with a counterfeit chip and it does not fit well and some of the language and terminology used here can be confusing to some folks..... and if that's not enough we have great folks from all over the world on this site. They come from Greece, England, Norway, Australia, Italy, USA, Korea, Japan and China..... Those are the countries that I remember and we all talk a little different English.

So bear with us as we all get the same pay and enjoy our hobby.

I would try eBay. Search "sma f so239". They range from just under $4 to $6 depending on if you get it from Hong Kong or from a USA dealer. Just make sure it is an SMA female for the end that goes to the radio.

You might think about getting an HT Saver cable instead. It is 3' of RG174 with an SMA female connector on one end and an SO239 on the other. The smaller cable supposedly removes strain on the HT. It is considerably more expensive though. $14.50 at this auction: 251044439793

This work around deals mostly with the Chirp software's ability to transfer the "out of range" freqs to the UV-5R. The UV-5R may or may not accept it and may or may not work on it. The ranges of the UV-5R are governed by the firmware and the factory software..... not so much by what we write to its memory.

My guess would be that you would not be happy with the results. But, it's only $50. Give it a try and let us know.

I would make sure that I had an original configuration file BEFORE I did anything. Perhaps you then could get back to square one.

Thanks Paul.

I was just looking for a hand. What I just got from George, is not something I'm going to be distracted by. I'm busy.

I've been a ham op for almost 18 years and I already posted a very long, detailed account of what I have done already and the results.

The cable "not pushed in" thing is just ridiculous and not worth my attention anymore.

So anyways. Paul, I did some more experimenting today with drivers and the cable that came with my TYT radio a year ago. I used Chirp, the TYT UVF1 and the cable it came with, with the driver I got here and the radio was obviously trying to transmit data when I chose the Baofeng menu in the software. It ultimately didn't do anything, but at least the test allowed me to see that cable was capable of transmitting data through it at least one way. This tells me the driver works and the indication that it is "working" in the device manager is indeed the truth there.

The cable which came with the Baofeng's doesn't work more than to flash the LED once in a while on plug in. I would bet the radios themselves are the issue, or the cables (both of them) are just not capable of complete data flow.

A friend has the same radio and was able to program it on his computer, so I'm going to see if I can work out a trip to go see if my radios will work on his system too.

I'll let you know how it goes. In the mean time, if there is any serious information to pass on about programming, I'm all ears. The drivers, cable push, ability to use various operating systems, and other minor details have been worked out. Read my first post.

Thanks
73

How about eBay item
280912695521 which at $2.48 is about the cheapest you'll find. Just have to wait for it to come from Hong Kong.Anywhere you go looking you want an "SO239 to SMA-female adapter".Ian

Can someone tell me where an adapter for the antenna can be purchased to allow me to connect to a L259 connector. My motor home has a dual band antenna mounted on top which i would like to connect to when traveling.

Sam

George,

Oh knock it off. Go get some fresh air or take a vacation. You're obviously stressed out in your life or angry about something. Take some vitamin D or eat more fiber.

You don't me and you're taking this yahoo group thing way too seriously. Maybe working with computers all day is taking a toll on you. Go jump on that trampoline in your backyard or something.

Just some trial thoughts,...

It sounds like you have the driver pitfalls navigated, and you're using a cable that (I assume) is "proven good" with another radio. Could it be an issue with the connector contacts in the radio?

More than one of us has experienced problems with this. No insult intended, but as you may have already read, folks have actually razored off plastic from the cable fitting to get the prongs to go in deeper. Drastic and ugly, but some noted data transfer when they pressed hard on the fitting, so they went to that extreme.

Or dirt or plastic flash from manufacturing is stuck in there somehow? Does an external speaker/mic or the supplied earpiece work correctly?

Trying with your friend's setup is a good move. It will determine if you simply have a defective radio.

Don't give up.
Ian

I used Chirp, the TYT UVF1 and the cable it came with, with the driver I got here and the radio was obviously trying to transmit data when I chose the Baofeng menu in the software. It ultimately didn't do anything, but at least the test allowed me to see that cable was capable of transmitting data through it at least one way. This tells me the driver works and the indication that it is "working" in the device manager is indeed the truth there.

The external ear/mic works fine. There is nothing in there and the pins are as far as they go (and actually longer than the mic/ear). There is no plastic to cut, as the pins terminate at the base as the metal they are. Pushing does nothing and pulling on it crashes my computers.

And we're talking 3 Baofeng UV5's and 1 TYT UVF1, with one TYT 9000 mobile. None work with any of the three cables I have on XP, Vista, Win7 over 4 different computers.

Let's stop beating ourselves over the head on this one. Obviously I can't help because I'm at least 6,000 miles from you*, but there must be someone nearby who can.

Post your general location, and let's see if there is someone who can elmer(mentor) you.

If all else fails, I'll call you on the phone and try to walk through it, but let's see if there is anyone who can help you locally first.

Geoff

* I say that because the Israeli ham community is so small that you would probably know me and if you were in Jerusalem and 2m, you would definitely know me.

I would not wish to do that. Not for any electrical reason, (although there could be a few!), but simply that the connector you seek is heavy, and fixing that to the top of the radio, with possibly thick cable, may not do the radio antenna jack any good.

Look up S002S (silver) or S002G (gold)on ebay, 409shop or similar. which will convert the top of the radio to BNC. Then maybe a BNC plug suitable for really thin co-ax, a short length of coax, and then whatever connector you need. (Line SO239?)

My UV-5R has the S002S, and when screwed all the way in, I noticed a small gap between the bottom of the adaptor, and the top of the radio. Maybe 50 thousandths of an inch. So a small plastic washer takes up the gap, and removes the strain from the center part of the jack.

HTH,

73 de Stan, G4EGH.

Holy cow, prices are getting up there. I'm seeing buy it now's at $90-100.

As I think I caught my radios at a good time (not long after hitting the market), I also notice that for a while, the UV-3R was almost as much as the UV-5R.

Is this low intro price and gradual increase typical for new radios? As the kinks get worked out it starts costing more. As a newer ham, I haven't dealt with radios before and was wondering.

I believed that all the driver problems had been settled in regards to uv-5r and the chirp software. In short, the uv-5r programs fine with virtually no problems.
So last week I made an upgrade to my browser, in regards to the internet, an obvios seemingly irrelevent none driver issue.
On Saturday I needed to do some programing with the chirp software but alas, it not work. I went to the device manager and for some strange reason com port one was not there on the list. What is odd is that com port one showed itself as in use, but clearly was in conlict somewhere as it was not there in the device manager.
Important: All I did to fix the problem was this, I deleted the win vista 32 bit prolific usb 3200 and the reinstalled it. Bingo done.

Subject: [baofeng_uv5r] EBay prices

Holy cow, prices are getting up there. I'm seeing buy it now's at $90-100.

As I think I caught my radios at a good time (not long after hitting the market), I also notice that for a while, the UV-3R was almost as much as the UV-5R.

Is this low intro price and gradual increase typical for new radios? As the kinks get worked out it starts costing more. As a newer ham, I haven't dealt with radios before and was wondering.

Turn the power off in your house and then turn the breakers on 1 by 1 to see where the noise is coming from. Likely your plasm TV.

99% bet it is something in your house. It isn't the metal roof.

Oh, check to see if the NSA has planted some bugs.

Suggest you use this adapter on the radio-
http://www.ebay.com/itm/330482289744?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649
And then a short RG-58 BNC to 259 cable- The 259 adapter on the radio is unwieldy particularly if you are using large coax.

Dogdude,

My guess after seeing that you are working with..... 5 radios , 3 cables, 4 computers and 3 operating systems..... is that you are having issues with using your Radio Programming Software as it is the only common denominator here. Now the problem can be with how you are dealing with the drivers or the software itself. If you get the same result using Baofeng and CHIRP then I would suspect the driver issue to be the culprit.

I also remember in one of your posts that you said the cable worked OK, the only way that it works OK is if it actually transfers data to the program.

As one suggested, perhaps there is someone close by that could put a fresh set of eyes on the problem as quite often we continue to repeat a mistake by assuming all is OK.

It is not reasonable to assume that all of your equipment is bad.

Please keep us posted.

John

Subject: [baofeng_uv5r] Re: Baofeng Uv-5, and others here

The external ear/mic works fine. There is nothing in there and the pins are as far as they go (and actually longer than the mic/ear). There is no plastic to cut, as the pins terminate at the base as the metal they are. Pushing does nothing and pulling on it crashes my computers.

And we're talking 3 Baofeng UV5's and 1 TYT UVF1, with one TYT 9000 mobile. None work with any of the three cables I have on XP, Vista, Win7 over 4 different computers.

I would agree. Unless you have a way to make the radio and cable rigid, you will end up destroying the antenna connector on the radio. The one from RadioShack may be pricey. But if you want it today, it is there Else find another like it online. But it will keep your radio in one piece..

You must be looking at some sort of bundle like 2 radios or with extra batteries or something. The uv-5t by itself is still less than $50 all over eBay.

Kind regards,

Ray

271030330073 bundle of 4 for $399
261077448242 bundle of 2, $195
251122827753 1 radio for $89

EBay item numbers.

DogDude. I agree with you totally.
If you have friend that has a setup that works, match the two together.
If there are two issues at the same time, say a bad driver and cable together for example, you'll go freekin crazy.
Please let us know what you find out. Keep the faith.

Ouch. Multiple radios, multiple cables, multiple computers, and still no-go?
John is right. We could all calm down a little. It could be something really obvious that we're all missing. It has happened before, more than once. No need to get whizzy about anything.
I remember one fellow who was tearing his hair out until discovering that the program that came on the CD with his cable was for a completely different radio. (They often package one CD for many products and offer *no* guidance what to use from the CD for the one radio you actually bought.)
Folks here use either the Baofeng software, available in the FILES section of this group, or CHIRP. Only the "daily builds" of CHIRP currently support the 5R.
Note that the Baofeng software "forgets" which COM port your cable is on every time you load it up. You have to specify that over again every time you run the program.
Keep feeding us information Dogdude. The answer is out here somewhere.Ian

That's because they ship it from the US.

Look carefully at the pictures, am I wrong or is it missing something?

Geoff.

Make sure that your radio is NOT set for PL/CT or DCS on RECEIVE.
If this is on, you will not be able to receive anything without the correct code.

They are actually out of Germany. I don't know what that means to the price. But clearly their prices are way out of step with the rest of the offerings. They are currently an anomaly and not the norm. So I would not categorize them with the other dealers at all, at least at this point. One dealer that has completely whack pricing does not constitute across the board price increases.

6056. need to know how to wire desk mic to uv54 or where to just buy one

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-13 16:49:24 UTC
From: frankpasta
Topic: 6056 Message: 6056

I have my uv-5r rigged as a base station here at my home.
It is connected to external speakers hand mic ect. so it's more or less a permenent install (not portable).
The finishing touch would be a desk mic, one that plugs into the small mic jack (top jack) on the uv-5r. I have looked everywhere on the net including ebay all to no avail. The guy down at "Best buy" say's I can not use a pc mic with a momentary switch even if they could be bought with the tiny mail jack. Can someone advise me on a circuit for this project or where I can just purchase one? I would much rather buy it.

Pulling on it crashes your computer????

I think we can all stop now. He's obviously trolling.

Hello,

I'm new here and after doing some research in the posted messages I still have a question concerning the setup of my programming USB cable in Windows 7 (32bit).
So I'm getting the info that there is an unknown USB device and then whe n I want to load the Win7 drivers (I have downloaded to a folder) the system tells me that no updated drivers have been found? Result : I can't use my programming cable...

So, should I consider purchasing an another USB programming cable? I'm running out of ideas to solve this issue.

Thanks for all useful info or tips.
Daniel

I would think any mic would work. Using a switch, setting the radio to VOX should do the trick. Switch the mic on, talk and shut it off.

Hope this helps

Here is a schematic of a mic, as you can see the audio goes to the center ring of the large 3.5mm plug and shield to the back or 3rd ring of the same.

PTT goes to the 3rd ring of the small 2.5mm plug.

Oh, isn't the bottom 3.5 mm jack for mic? The top 2.5 is speaker. IIRC.

Radio Shack had 3.5 to 2.5 adapters, or you can solder a new plug on the
end.

Hi...

You've probably already tried this, but.....

With my radio, I found that that everything had to be connected first, then the software loaded, and then, only after it was loaded, the radio turned "ON". Nothing else worked consistently for me.

System was WinXP, running an AMD 64bit processor, with 2gb ram. Don't know if the AMD/XP patch played a part in this, or not.

First off let me say I am not an IT guru.

That said, from my hard experiences, my Laptop an I-7 Toshiba, has

5 USB ports.

I found the "MASTER" USB port.

I could not get the UV5R factory software to recognize my laptop, did a little research and called my Son-in-Law who is a Guru and he said "POP, try all the installed USB ports and you will find one that works"

He was right.................

Just sayin guys.......

Forgive me if I'm stating the obvious, but some hams aren't computer folk, so this advice is for that event,...
If you have downloaded "drivers" with a file extension of ".exe", you haven't gone far enough--their mere presence on your machine will not take effect. Those are executable install programs, and need to be run. Double-click the filename.
That will add the drivers that those .exe programs contain to Windows' arsenal of drivers available for devices (like your cable). Then when you plug in your cable, Windows will search its inventory for a suitable one for that device, and should now find it.
I recommend you read "Cables, Prolific PL2303 Drivers, and WIndows 7.pdf" from the Files section of this group. There are many pitfalls.

Frank,
Go to eBay an dlook again. Search "desk mic" and jump to the third page. There is a brand new Motorola desk mic for $30 shipped. Oh, and I had US Sellers and Buy It Now selected.

The files area has more than one schematic showing the pin-out of the connectors.

Another thing you might be able to do is buy a cheap (about $6) speaker mic. Your could remove the speaker mic an use the cable to replace the desk mic cable or at least splice the two together.

Good luck,
Jim KC9HI

You might check Amazon. They're selling in the $50 to $60 range with the option of next-day delivery.

Amazon is a good choice if you want to minimize risk, especially if Amazon is doing the fulfillment, but you'll pay a bit more.

If you're price-conscious, Amazon-fulfilled orders can have free delivery if you're willing to wait a few extra days. I'm not sure how it works, but I think Amazon batches their "super-saver" option for shipment on Mondays. Other than that I don't see any difference in speed from the standard shipping option. (Your mileage may vary)

I've no idea if this impacts the "freshness" of product.

Not only trolling, but now stalking.

Congratulations, dude, but my internet existence is an open book. You can
even find my address and call sign easily.

I don't care....however you get your jollies is your problem.

Mac,
I would be interested in knowing what OS you are running (I assume Windows 7), whether it is 32-bit or 64-bit and the driver version you are running?
Thanks in advance,
Jim KC9HI

Let me know when you find one.

Note to all.... don't buy the USB cable - it is crap.... just buy the RS232 one and then use a USB adapter you know that works.

But, if someone wants me to start one, I will ...

Sorry meant to send this earlier but here is what we got for the SWR numbers on the two antennas in various UHF bands. As you will see the Baofeng out performs the generic eBay antenna by a bit. I added the VHF numbers too. You'll see in that range that they are both decent in different ranges.

Stock Baofeng
420MHz - 3.0
422 - 3.1
424 - 3.1
428 - 3.2
430 - 3.4
432 - 3.2
434 - 3.3
436 - 3.4
438 - 3.5
440 - 3.8
442 - 3.7
444 - 4.0
446 - 4.1
448 - 4.4
450 - 4.6

142MHz - 1.7
143 - 1.4
144 - 1.6
145 - 2.0
146 - 2.4
147 - 3.1
148 - 3.6
149 - 4.0
150 - 5.1

Generic eBay Antenna
420MHz - 4.7
422 - 4.7
424 - 4.7
426 - 4.8
428 thru 450 - 7.5

142MHz - 7.3
143 - 6.2
144 - 7.6
145 - 2.7
146 - 2.0
147 - 1.5
148 - 1.3

149 - 1.2

The point is, you don't need to be an IT guru to get an RS232 to USB adapter working.

It is supposed to just work, and if you buy a good one, not the one from 407Shoppe, it will work.

As I said in another thread for anyone ordering cables, DON'T order the USB programming cable.

Order the RS232 programming cable and then buy a non-cloned RS232/USB adapter from Walmart (you get the idea).

Remember, it is supposed to work simply. It doesn't as it is cloned and therefor you get driver conflicts.

I am an IT expert and after figuring out that in 2 minutes it was a bad clone, I threw it in the garbage. Seriously.

Mike va3mw

(I am going to do 1 more post on this, so bear with me.)

6087. Do NOT order the USB Programming cable - please read

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

If you don't know what a driver is, or a com port and just want it to work...

Do NOT order the USB Programming cable.

Instead, order the RS232 cable (non-usb).

Then, go to your local computer store and pay the $25 for a properly designed, non-cloned RS232 to USB adapter. If it works, great. If not, you can take it back and get the right one.

If you like puzzles, feel free to order the USB programmer. :)

Make sure that your computer has a serial port. Most newer PC don't.

6089. Upper and lower limits

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-13 23:00:59 UTC
From: GMyers
Topic: 6089 Message: 6089

I have read through a lot of post here and did not see one with the answer to my following question. Is it possible to change the limits on UHF and VHF so only the FCC approved frequencies are available? On CHIRP in the (Settings) - (Other Settings) it appears that this can be programmed, but when I do this and up load to the radio, nothing seems to change. Please help as I do not want to transmit outside the bands.

Gene

My netbook does not have a serial port. I did not have any problems with my usb programming cable.

Freaking AWESOME suggestion. But this requires newbies to know what a serial cable is and how to use one. So the problem is not solved, only compounded.

First, read the initial email. Hence the reason for getting a GOOD adapter

2, good adapters just work. Clone Prolfic just don't work ... enter wizard mode

3. if they can't figure out a com port, they need to look on Youtube and watch the thousands of videos there on Com ports

I don't mind helping with radio problems, but every day, and I mean every day, we have someone who doesn't know a com port. This has turned into a chat group for windows support.

If they can't get a com port running, they need to ask a 12 year old kid. He'll figure it out.

I have no less then 15 different USB/Serial adapters that I have bought from Walmart, Best Buy, Tiger Direct, Canada Computers and they ALL worked just by plugging them in.

Repeat... non-copied Chines adapters JUST WORK!

Off soapbox.

Wow. I can't believe how bad the SWR is at UHF. That's so counter intuitive. I mean a SWR of 3 means 25% of the power is reflected. That's bad.

I can't believe how good it is at the low end of VHF. Thanks for the data.

Anyone have SWR data from the nicer V/UHF antennas (like the Diamond)?

Is there a decent reverse SMA V/UHF dual band antenna (backed up by independent test results)?

Thanks,
-Brad

PS
Mine also gets hot during long transmissions.

--- In baofeng_uv5r@yahoogroups.com, Kate and Ray <raynkate@...> wrote:
>
> Sorry meant to send this earlier but here is what we got for the SWR numbers on the two antennas in various UHF bands. As you will see the Baofeng out performs the generic eBay antenna by a bit. I added the VHF numbers too. You'll see in that range that they are both decent in different ranges.

I 100% agree with you. I just don't think the problem will go away.
Users don't differentiate between the radio and the computer especially
If they are here asking these mundane questions about how to use or
troubleshoot a USB adapter. If they can't even figure that part out,
then having to get a Serial cable AND a USB to serial adapter is going
to make their heads explode.

I also agree that the windows support questions are completely out of
control. All the needed information is in the files section, or
elsewhere online.

Gene,
You can change the limits with CHIRP and the Baofeng VIP software to a degree. The way I understand it, the limits imposed are only relative to programming with the keypad. You will still be able to program the full range of frequencies with the software.

Don't want to get on a soapbox, but none of the LCRs use 'Reverse SMA' antennas. They either are SMA Female (if the radio is Male-UV5R/Wouxun) or SMA Male (if the radio is female- UV3R). 'Reverse SMA' connectors are special SMAs used with WiFi type equipment and they are quite different from regular SMA connectors- they simply don't mate. I guess this is good since we don't really need more 'Reverse SMAs'.

Nope, have the radio in channel mode with attached USB cable, going thru the 3 available ports, and it keeps giving error, failure to read.

I just came here for help with my radios.

So, enough of all this bickering. Peace?

Well, anyway... we got rain and lightening here. Maybe a bolt will help the cable Ignite the radio? Who knows...like the storms in Nebraska. I had a Morse code qso the other day with someone over there. They were operating from Kansas State, which was strange because Auburn is the location? Beats me, I just called it spelunker and turned the VFO.

I'll let you all know how the programming goes when I see my buddy with the computer and cable that works. :)

6102. RE: [baofeng_uv5r] Re: Antenna Observations UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-14 00:38:41 UTC
From: Rob S.
Topic: 5819 Message: 6102

Good information raynkate, Thank you 8-)

What was the setup you used (meter, cables, connections etc) ?

I would like to duplicate it (if possible) and test the antenna I’m running, a Nagoya NA-771 (and post the results if people are interested…)

Cheers,

Rob.

Subject: Re: [baofeng_uv5r] Re: Antenna Observations UV-5R

Sorry meant to send this earlier but here is what we got for the SWR numbers on the two antennas in various UHF bands. As you will see the Baofeng out performs the generic eBay antenna by a bit. I added the VHF numbers too. You'll see in that range that they are both decent in different ranges.

Stock Baofeng

420MHz - 3.0

422 - 3.1

424 - 3.1

428 - 3.2

430 - 3.4

432 - 3.2

434 - 3.3

436 - 3.4

438 - 3.5

440 - 3.8

442 - 3.7

444 - 4.0

446 - 4.1

448 - 4.4

450 - 4.6

142MHz - 1.7

143 - 1.4

144 - 1.6

145 - 2.0

146 - 2.4

147 - 3.1

148 - 3.6

149 - 4.0

150 - 5.1

Generic eBay Antenna

420MHz - 4.7

422 - 4.7

424 - 4.7

426 - 4.8

428 thru 450 - 7.5

142MHz - 7.3

143 - 6.2

144 - 7.6

145 - 2.7

146 - 2.0

147 - 1.5

148 - 1.3

149 - 1.2

I'm curious to hear what the UHF numbers are.
Thanks for the research.

Hi all....just got my radio today and charged the battery. All OK except when I did a reset after having some programming issues (wanted to go back to square 1) now the radio audio is all Chinese not English. Help>> Manual is silent on this issue.

Freaking AWESOME suggestion. But this
requires newbies to know what a serial cable is and how to use
one. So the problem is not solved, only compounded.

On 8/13/2012 3:45 PM, Michael Walker wrote:

If you don't know what a driver is, or a com port and
just want it to work...

Do NOT order the USB Programming cable.

Instead, order the RS232 cable (non-usb).

Then, go to your local computer store and pay the $25
for a properly designed, non-cloned RS232 to USB adapter.
 If it works, great. If not, you can take it back and get
the right one.

If you like puzzles, feel free to order the USB
programmer. :)

There are ways to make the original cable work, and beyond the scope of this discussion.

They are clearly outlined in the files section.

Short story is that there are more good reasons to have a solid plug and play USB/RS232 adapter that you can rely on rather then dealing with a device that has to have a back rev'd driver that will break again the next time you plug in a new device that uses the prolific adapter or a Windows update pushes down patches.

Or, you have a 12 year old that knows how to use Google and can fix it. :)

Don't forget. Those trying to use these should have gotten their ham license at some point. Last time I checked, getting a ham license was a technical exam. Unless all those using these are not hams and are just using the radios for non ham activities, but I digress.

Try menu/14/2. That is, press menu, 14, menu, 2, then menu. Or maybe it's 1 instead of 2. Mine is only on or off, but new ones are bilingual.

Amigo,

Primeiramente, muito obrigado, por toda atenção.

Não entendi corretamente.

Ajude-me, por favor :

Você recomenda tentar o MENU 4 E DEPOIS ACIONAR A TECLA, # ?

SERIA ISSO ?

Ou seria mesmo o contrário :

ACIONAR O # E EM SEGUIDA O MENU 4.

E DEPOIS ?

O QUE DEVO FAZER, POR FAVOR ?

MUITO OBRIGADO UMA VEZ MAIS.

ALMEIDA - LIMEIRA - SP - BRAZIL.

HI folks,

Just a quick note about antennas: you need to get an antenna tuned for the bands that you work.

These radios have an pretty large TX range: 136-174 VHF and 420-480 UHF. That's not just 2m and 70cm ham bands. No short antenna is going to cover the entire TX range so *all* portable antennas are going to be a compromise. None are going to cover the entire TX range at low SWR.

These radios are Type 90 devices and their antennas are quite likely tuned for the common LMR bands. Testing their SWR is informative and useful. It would be nice to go beyond the ham bands to see were the tuning is centered. But I don't think that it is fair to expect low SWR on the ham bands. That's just projecting expectations onto a LCR that was not specifically designed for that task.

For the ham bands I am interested in, the NA-701 seems to work very well. YMMV.

6118. on diamond rh701...

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-14 03:53:59 UTC
From: essworks
Topic: 6118 Message: 6118

i read back on the antenna alternatives & couldn't find a reference on matching an rh701 with my uv5r.

my baofeng came with a nagoya 773 telescopic antenna... works well enough but i'm concerned about bending the thing in the field. i had the rh771 in mind but they're not available at my side of the pond.

i'm thinking the na701 & rh701 are brothers from different mothers... read somewhere that nagoya & diamond are made by the same company. so, is the rh701 anything like the na701 in terms of overall specs?

cheers!

Hi Bob,

The Nagoya NA-771 is a purpose tuned (according to the manufacturer) 2 Meter / 70 cm Amateur antenna for the Ham bands, general reports say very good on 2M and so so on 70…

Cheers,

Rob

Good information raynkate, Thank you 8-)

What was the setup you used (meter, cables, connections etc) ?

I would like to duplicate it (if possible) and test the antenna I’m running, a Nagoya NA-771 (and post the results if people are interested…)

Cheers,

Rob.

Sorry meant to send this earlier but here is what we got for the SWR numbers on the two antennas in various UHF bands. As you will see the Baofeng out performs the generic eBay antenna by a bit. I added the VHF numbers too. You'll see in that range that they are both decent in different ranges.

Stock Baofeng

420MHz - 3.0

422 - 3.1

424 - 3.1

Gene
you said "Please help as I do not want to transmit
outside the bands." I take this to mean you want to receive but want to prevent accidental transmission (such as when folks want to monitor public safety frequencies, etc).
in chirp set your duplex to "off", or in baofeng just remove the transmit frequency from the spreadsheet. No transmit. You can find more information in the chirp users guides, should you be interested in what the other settings do in the software. Hope this answers the question.
charlie

>
> I have read through a lot of post here and did not see one with the answer to my following question. Is it possible to change the limits on UHF and VHF so only the FCC approved frequencies are available? On CHIRP in the (Settings) - (Other Settings) it appears that this can be programmed, but when I do this and up load to the radio, nothing seems to change. Please help as I do not want to transmit outside the bands.

Damaging the NA-773 is the least of your problems. Performance is very poor, and SWR is 1:3.0 or higher. At some point this antenna *will* damage the PA module of your UV-5R. Trash it or use it on a scanner.

You're right about the 701 models. They seem identical, but I never tested the Diamond version. Good antennas, well balanced performance on both bands.

Amigo,

Quer uma antena espetacular para seu Baofeng, UV-5R ?

Então experimente a NA-774.

Muito interessante e com rendimento espetacular.

Can UV-5R be programmed to receive extended frequency like the UV-3R? I can't find the INI file for UV-5R software.

Extended frequency for UV-3R.

Jim, I bought my UV5R at a Hamfest in Milton.Fla, near pensacola.

The business that had my HH gave me a disc with the driver.

In the world of famous brands, "E" versions are programmed for Europe, and can't transmit out of ham radio bands.

If I can trust the specs, this doesn't seem to be the case here. All I can see is a protective screen of sorts. This might be just a change in exterior design.

Yes, that could have been me, or someone else who did actual lab tests on the NA-773. We have to repeat things a lot here ;)

Don't forget the famous $3.71 antenna as an alternative. I have bought 12 of those now, and distributed them amongst UV-5R owners. It's even cheaper now at $3.41.

Performance is as good as it gets, and there's no gap between the base of the antenna and the UV-5R. Most other antennas need a washer.

See http://www.ebay.com/itm/180903233474

6131. Dual watch

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-14 10:39:39 UTC
From: g4ilo
Topic: 6131 Message: 6131

I don't know if I'm the only person on this list that didn't know it already but I have discovered that when the UV-5R is in dual watch it actually receives on two frequencies at the same time. I just had a QSO with someone on a local mountaintop and whist he was talking I heard the local repeater identify in Morse at the same time. Perhaps both frequencies have to be in the same band for this to work.

Trying to read these messages here but my next message link that was in the middle of the screen has gone. Any way to get it back? The next message link on the right of the screen links to the next topic not the next message.

Why do all the messages have all the preceding messages as quotes? Makes it difficult to read through the topic clearly.

===
btw I ordered a USB cable from China last week and it's only taken a week for delivery, however the British Royal Mail thought it would be fun to knock and run, so I'll have to wait another day to pick it up now from their office. :(

I do like it, in fact it is brilliant. I don't think my Kenwood or Yaesu radios could do that. I thought with Dual Watch the receiver would hop between two channels and I'd only hear the one it stopped on. To monitor two channels at the same time is incredibly useful especially as the radio is clever enough to transmit on the channel last heard (though it's probably a good idea to check where the arrow is pointing before pressing the PTT.)

Yes, indeed Julian, a very nice feature.
From the infirmary last Friday, I was working G3WTO at the other end of town on our natter freq.
On passing it over to John, I noticed my 5R was rx'ing GB3CA!
So I think it is dual band in that sense BTW our local freq. is is VHF!

One problem, if you want to qso on the other freq. you have to "kill" the Dual Watch. . .. . but thats a small thing!!

Ok, just order 2 $3.42 antenna. Have received a Nagoya 701 this last
week. Ordered it based on eham reviews, before the thread about how
quality took a dive started on here. Gonna see how these do.

Well Mike,

I guess that we don't know what's in the driver anymore than we would know what was in a 232 unit we picked up at Walmart or Best Buy.

I can say that a virus of some sort became evident to me because of the cable/driver issue coupled with a difficult to understand User Manual. That virus has turned into one of the best Yahoo Groups I've been exposed to and brought me in contact with the world in a much different way, not all positive but different.

BTW, I sometimes worry about my deodorant for the same reasons..... is it really safe to put that stuff on?

Keep life light and constructive.

Yes. We really know.

By your reasoning how do we know any driver updated automatically by
Windows doesn't have malware with it?

Please stop spreading FUD.

The USB cable works fine if you follow the instructions.

Not everyone wants to pay $25 or more on a cable set for a radio that costs
less than $50.

Sorry, but it isn't FUD.

I do this for a living and I have examples of driver installations coming in from China do have root kits in them. And, your AV software won't find it. It isn't good to hide your head in the sand and 'assume' it doesn't happen.

While you know, others are not aware and are just assuming that all is good. Everyone has a choice. I am just making them aware of it.

It is clear that most people don't read every email and they aren't technically inclined to understand the risks. If they did read all the emails, then they won't be asking every day why their USB adapter doesn't work.

This is just my opinion of course. Your mileage may vary.

While I don't think they will go to that extreme, I am not happy with the new front cover. It is thin plastic and will crack and break, get scratched, and or discolor with the typical use a HAM radio would get. Personally I think they got it right on the first go-round. Now it looks more like a toy. But that is my opinion. YMMV.

So if Menu 7 TDR is ON, then it will monitor both frequencies in the display?
So it would be limited to one UHF and one VHF, or is there a way to have two frequencies from the same band in Dual Watch?

Does it work only in VFO mode, or only in pre-programmed Channel Mode?

On my units with Menu#7 TDR set to ON and Menu#34 is OFF. You will monitor whatever freqs that are on A or B. My units stop on the last received freq and allows me to transmit on that active freq.

If you set Menu#34 to A or B then that will be the freq you will transmit on regardless of which freq was received last.

Hello !!!!

With TDR set to ON, it will monitor whatever you have showing. Frequency mode or channel mode, and any mixture of bands. Amazingly flexible. Most of the time, I listen to my favorite local repeater, and the sheriff dispatcher. Catch all the excitement (chuckle) :-)

Have Fun!!! Bob K6WL

It will watch whatever is in the display, regardless of UHF/VHF. A/B use the same memory bank. You pick whatever you want for each. Remember that which ever A/B was last active will be the one you key up on if you press the PTT. There are also some down sides to this mode. If one of them is busy and you want to transmit on the other, it will be difficult. So get used to switching to menu 7 and turning TDR off when you need to.

For instance you can have a channel on A and then scan on B. Menu 34 TDR-AB lets you set which (A or B) the radio will return to when TDR is on. Play with the 2 settings to figure it out. That is part of owning the radio and being a HAM!

All the local traffic is on 2m here as well.

Are you sure you have to disable Dual Watch from the menu before Txing? It appeared to me that you only have to press A/B and see that the arrow is pointing to the channel you want to transmit on. The arrow switches automatically between A and B depending on what it just heard so even that step is not always necesary.

I thought with Dual Watch the receiver would hop between two channels and I'd only hear the one it stopped on. To monitor two channels at the same time is incredibly useful especially as the radio is clever enough to transmit on the channel last heard (though it's probably a good idea to check where the arrow is pointing before pressing the PTT.)

As I stated, if the second frequency is a busy one, as soon as you press the A/B it will go back to the one that is busy. The last one recieved on will always be the "active" one. So yes, it can be needed in certain circumstances.

My radio is set the same as yours. I'm glad I discovered this by accident.

I haven't tried, but presumably if I listen to FM radio with dual watch on, it will interrupt the music whenever a signal comes up on either of the dual watch frequencies (or channels.)

I see. Only one of my channels was in use at a time so I hadn't experienced that. It's a pity it doesn't stay on the side you selected with A/B long enough for you to press the PTT.

For this testing we used the MFJ-269 analyzer with the antenna connected directly to it via an SMA to PL259 adapter, no cables. Also, the analyzer ground was connected to an RF ground system.

What is the difference for UV-5RE when compared to the previous UV-5R model? their specs are the same to be?

http://www.409shop.com/409shop_product.php?id=108709

Yes. It's FUD.

I also do business in China. I've been there. I've helped develop
software and hardware products in China that have been distributed
world-wide.

It's not the horrible problem you make it out to be. If it is, then you're
doing it wrong.

Yes, there is malware out there, but none is coming from this USB cable
driver.

The USB cable works if you follow the instructions carefully. Get over it.

Can you guarantee me that your USB to serial driver will never cause anyone issues? Why can't it be a vector for malware?

This discussion is silly.

The USB cable works fine if you follow instructions. There's no malware in the driver and nothing to indicate there will be.

Any piece of software can be a vector for malware, but to single out a particular piece of software with no rational reason is ludicrous.

Again, you're just spreading fear and doubt.

George

Wait a minute. There seems to be a general lack of understanding what is happening here.

Prolific wrote the drivers for their USB bridge chips. You can find them fairly easily (look in the files section).

The problem is that the Windows XP version of the driver works fine with both CHIRP and the BAOFENG software. They use different "serial port toolkits" (pre-made software for accessing the serial port) and some driver versions work with one and not the other.

For the record, CHIRP uses an open source public domain toolkit that comes with the version of Python used to run it. The UV-5R software uses the closed source "black box" Microsoft toolkit that comes with whatever "Visual" development environment they used. Just for completeness, the UV-3R software used yet another toolkit and it does not seem to be picky about the drivers.

After Windows 7 came out, someone in China started selling Prolific compatible bridge chips.

They work with the PROLIFIC Windows XP, Vista, and early Windows 7 drivers. They also work with Linux, and AFAIK MacOS.

As long as you use the correct drivers from Prolific, you will have no problems with the original or compatible chips. Someone else went to a lot of effort to document exactly how to do this, so look at their work and don't forget to thank them.

Since these drivers came from Prolific, they are 100% safe. If you don't trust a source, you can find them elsewhere. Use some discretion as in don't download them from sites known to contain software with viruses.

The problem with Windows 7 and I assume Windows 8 is that the people at Prolific found out their chips were reverse engineered and decided to do something about it. So they found a weakness in the copy of their chips and wrote new drivers that check. If they find the wrong chips, no matter how compatible they claim to be the driver will ignore them.

Most people have their Windows systems set to automatically update their software, and 99% of the ones that do it by hand never look at what is being updated, or if they do, don't stop it from updating the drivers.

So all Prolific had to do was to release a new version of the driver, with the check in it, and everyone who blindly or automatically does a software update gets it pushed on them.

AFAIK they made no effort to do this to the XP or VISTA drivers, so you are safe. :-)

It is important to understand that if plug in a cable with a Prolific chipset bridge chip (real or compatible) Windows will try to locate the driver on the internet if it set that way. If you have Windows 7, it will locate the drivers with the check, and most likely you are not going to have any luck.

Can you buy a cable with a real Prolific bridge chip? I expect that the LMR division of Kenwood sells them. Do any of the vendors that you know of? Probably not. No one is going to pay $100 or more for a cable they can get for $7 from an eBay vendor.

You could try to find one with a different brand of bridge chip. There are several, and the cheapest sells for around $3 on a little card complete with USB plug. You just have to add the radio cable and go.

Does anyone sell them? I was in contact with a guy on the UV-3R list that made them to order. His price was reasonable, but since I had enough cheap Chinese cables, I did not order one. I don't use Windows 7, so it was not a problem for me.

So you can easily avoid the driver problem if you read the instructions available and use drivers that are known to be safe and work.

If you have concerns about viruses, make sure to have running a good antivirus. My recommendation is the free AVG (not the free 90 day trial of the pay version).

It not only interrupts it but switches to that frequency. To go back to FM you have to re-switch.

I haven't tried, but presumably if I listen to FM radio with dual watch on, it will interrupt the music whenever a signal comes up on either of the dual watch frequencies (or channels.)

I think you can also try to remove all your phantom com ports.

Try this:

Here is how to have Device Manager show any "phantom" ports.

1. Click Start
2. Click Run
3. Type cmd.exe in the textbox and click OK
4. Type set devmgr_show_nonpresent_devices=1 and hit ENTER
5. Type cd\windows\system32 and hit ENTER
6. Type start devmgmt.msc and hit ENTER
7. When the device manager opens, click the View menu
8. Click Show Hidden Devices
9. Click on the + sign next to the Ports to see the full list of Com
ports being used
10. Highlight the port you wish to delete and then press delete

Aw, c'mon Mike.
How does anyone ever know that any file on the planet doesn't have a virus or an "undetectable root kit" in it? You take the usual precautions, don't do silly or overly risky things, and then deal with life. If you let yourself get paranoid without any cause you end up never going out of doors for fear of getting hit by lightning.
I know you have a soap box attachment to non-Prolific serial port cables over the USB direct-to-radio variety, but really. I try hard to stay out of pissing contests and don't want to start one with you. You've made your position very clear, many times.
Relax and enjoy.Ian--- On Tue, 8/14/12, Michael Walker <va3mw@...> wrote:

I have a question... how do we know if the 'other prolific driver' does not have a virus or an undetectable root kit in it?
Do we really know?
Mike

Forgive me if I'm stating the obvious, but some hams aren't computer folk, so this advice is for that event,...

If you have downloaded "drivers" with a file extension of ".exe", you haven't gone far enough--their mere presence on your machine will not take effect. Those are executable install programs, and need to be run. Double-click the filename.

That will add the drivers that those .exe programs contain to Windows' arsenal of drivers available for devices (like your cable). Then when you plug in your cable, Windows will search its inventory for a suitable one for that device, and should now find it.

I recommend you read "Cables, Prolific PL2303 Drivers, and WIndows 7.pdf" from the Files section of this group. There are many
pitfalls.

Hello,

I'm new here and after doing some research in the posted messages I still have a question concerning the setup of my programming USB cable in Windows 7 (32bit).

So I'm getting the info that there is an unknown USB device and then whe n I want to load the Win7 drivers (I have downloaded to a folder) the system tells me that no updated drivers have been found? Result : I can't use my programming cable...

So, should I consider purchasing an another USB programming cable? I'm running out of ideas to solve this issue.

Thanks for all useful info or tips.

Daniel

Thank you Geoff. Well said.

The safest place to get the driver software would be from Prolific. But for the reasons stated, they do not offer any drivers on their web site that will work with with the cloned chips. They even warn that their current drivers will not work with their older chips (probably a casualty of the clone wars).

This being the case, the older driver must be acquired from a third-party source. I would seek them out from reputable dealers of hardware that use USB-to-serial cables with their products. In our case that would mainly be two-way radio dealers. It would not be good for their business to supply their customers with 'bad' driver software. I would avoid or at least be very careful of driver software obtained from any where else.

Hi,

You can't. First, because the radio doesn't go below 136 MHz, and second, air band is AM, and this is an FM only receiver.

Hello All ---

Well, after running up the learning curve with my first UV-5R, and subsequently a second one, thought I would note a caution that I am sure some have already noted, because it can be useful.

My first unit turned out to contain firmware BFB251. As I began working with it, all seemed to go well in terms of programming. No complaints at all at this point. Next, I received a unit containing firmware BFB231. Things changed. Note that in both cases I am using the latest daily release of CHIRP.

Firmware BFB31 is significantly buggy to the extent that after normal programming, I must go back and properly set menu settings that either do not program, or are changed back to a default value randomly. This must be done manually. They simply will not program via CHIRP. No problem with data in the frequency table -- just the menu items. Behavior of frequency range control is different as well.

Thought I would mention this, since if someone looking to pick up a -5R for the first time especially, can make a request for a unit with firmware BFB251 (or higher) it will sure save some frustration. I also have seen here where new units are coming out, and marked as such, (-5RE)?, maybe that is the answer to avoid the bugs when you can.

My club will probably pick up a few more, but only if we can avoid the old firmware. Good luck all.

Regards, Cheers, Bob K6WL

Just a point of order here... Computers (including the one inside your
radio) are incapable of being "random."

> This must be done manually. They simply will not program via CHIRP.
> No problem with data in the frequency table -- just the menu items.
> Behavior of frequency range control is different as well.

This is likely just a result of them moving things around from one
release to the other. Avoiding the newer firmware forever is, of course,
not a solution.

Please open a bug on the chirp tracker and attach an image of the newer
radio along with a debug log. Descriptions of what *exact* behaviors
you're seeing would be helpful as well.

At the very least, it sounds like a good short-term measure would be to
cause chirp to not write the magic extra settings block (with the
frequency ranges) to the radio if it's of newer vintage.

Hello Dan -- first, I am not noting any "complaint" about CHIRP. It has worked well for me. The only purpose in my posting this experience is that it is possible for the more casual user to avoid some frustration by simply avoiding certain older radios if they can.

I do understand that computers are not random. I have spent over 40 years as an RF and digital EE, so I appreciate your comment. If I get some extra time (not easy nowadays) I will try and put something together per your request. Thanks for your feedback and the great work on CHIRP.

Now I hope I can find a way to source a few "new" radios. :-)

For this testing we used the MFJ-269 analyzer with the antenna connected directly to it via an SMA to PL259 adapter, no cables. Also, the analyzer ground was connected to an RF ground system.

What really started this discussion was the fact that their USB device is not plug and play and people are spending hours trying to get something working that should only take moments. Or, more importantly, should be plug and play.

While I sound like the rain maker, I do it so that people are aware of the risks. Yes, you can spend the time (and majour learning curve for some) to get the $7 device working. For most, this is very frustrating. It 'should' just work, especially in today's world.

The Chinese are well know and well documented for for hacking and cloning intellectual property and that is the reason we are were we are with their USB device. I have seen the risks and infected devices that have also included those cheap picture frames that once you plug them in to load pictures, they install keystroke loggers or root kits. Neither are detected by any AV program (include AVG, Security Essentials, etc...). Root kits are not able to be detected by running a Windows AV program. That is what makes them root kits.

It is good to be cautious. Even more secure by ensuring you are using signed drivers. Even well seasoned internet security experts (some of which I know) have been infected, and these are the people that know what is going on and how these exploits are transmitted or socially engineered into your computer. In one case, it turned into an identity theft issue and 1 of my employees almost lost his house. When we examined the computer, we had to remove the hard drive and use Linux to find the affected files. Pretty amazing stuff.

My recommendation is be secure and don't use your programming computer on anything that is personal, especially if it holds your banking or any tax information. Especially if it has your SIN number on it.

Am I scaring people. I hope so. The threat is very real. Heck, ever RSA, experts in security, lost most of their precious security data due to an infected excel spread sheet (and, no,
AV didn't pick it up).

Many 73 all,

Mike va3mw

Sorry Doggidude I did not remember your other posts. I now have over 4,000 of them and have trouble keeping track of the problems of which many if not most are common.

First let me say that I know of only a couple of units that have sounded like they needed to be returned for replacement. That said let's assume that the issues are on your end and that the radio is not at fault. I can tell you what my problems were and you can eliminate them as a cause. Yes, perhaps you have already done these steps. But from memory these are the problems that beset us.

The #1 Issue has been with the cable being seated in the radio. On mine the width prevents the ideal fit and it requires a push and a click is felt (I am hard of hearing).

#2 Matching USB/Serial/Com ports between the computer and the cable. The cable may have a copy of a chip in it that may require a different driver,

#3 Remembering that when using the Baofeng software you must always check to be sure your Com port is correct as it always resets to Com1.

#4 Always use the same USB port as when you set things up.

#5 On my cable/computer sometimes the USB port on the computer does not fit well with the cable and I get an error message.

To test this and for safety sake try to READ from the radio first and if that works save it to something like 5Roriginal or some such.

From your last post I am somewhat confused as you say that the cables are OK yet they don't transmit to CHIRP so how do you know that they are OK? You also mentioned a TYT and cables..... have you been using CHIRP for that radio and know how to do all of this? If so that takes us in a different direction.

Can I assume that you have the latest daily build of CHIRP for the UV-5R?

I do belive that there is a minor item that is being overlooked here and it sounds like communication between the computer and the radio which points to the cable/driver/Com port.

Keep us posted as we all learn from this !

John

Subject: [baofeng_uv5r] Re: Baofeng Uv-5, and others here

Thanks Paul.

I was just looking for a hand. What I just got from George, is not something I'm going to be distracted by. I'm busy.

I've been a ham op for almost 18 years and I already posted a very long, detailed account of what I have done already and the results.

The cable "not pushed in" thing is just ridiculous and not worth my attention anymore.

So anyways. Paul, I did some more experimenting today with drivers and the cable that came with my TYT radio a year ago. I used Chirp, the TYT UVF1 and the cable it came with, with the driver I got here and the radio was obviously trying to transmit data when I chose the Baofeng menu in the software. It ultimately didn't do anything, but at least the test allowed me to see that cable was capable of transmitting data through it at least one way. This tells me the driver works and the indication that it is "working" in the device manager is indeed the truth there.

The cable which came with the Baofeng's doesn't work more than to flash the LED once in a while on plug in. I would bet the radios themselves are the issue, or the cables (both of them) are just not capable of complete data flow.

A friend has the same radio and was able to program it on his computer, so I'm going to see if I can work out a trip to go see if my radios will work on his system too.

I'll let you know how it goes. In the mean time, if there is any serious information to pass on about programming, I'm all ears. The drivers, cable push, ability to use various operating systems, and other minor details have been worked out. Read my first post.

Thanks
73

Are you able to measure the SWR with their antenna mounted on a plate to remove the 259 as part of the antenna system and then a cable to the MFJ259? Would that not accurately determine the resonance of the antenna.

Hi all,
programming cable works fine with my Wouxun and will write from the UV-5R but won't upload. Changes from UV-5r to a Vertex model when I upload unless I download and upload straight after (still won't upload though). Can't change the model on upload as it is not highlighted.
Regards Steve

Hi Steve

Sounds like you are using CHIRP? Have you installed the daily build?

I haven't used Chirp myself to date but this seems to be the most
frequently encountered problem. The "regular" download doesn't handle
the UV-5R.

No doubt others can offer more specific advice once day dawns over there
in that hemisphere.

Hi...

To impose our myopic view on the universe here in the States to others around the world is idiotic.

These radios have many uses outside the American ham bands, including the Australian CB Band.

Baofeng would have never bothered to design and build a radio like this for one market only. The design, development, and production costs would be to high for the "US amateur market" to support it.

And my usb cable works just fine, thank you.

73, Jimmie, K9JFK

Let's have some fun today!

I understand, I just want to try to work to get the problem addressed
instead of trying to avoid the issue by trying to get radios with a
specific firmware level.

I'll look for your report. Thanks!

Unfortunately "Plug and Play" doesn't always work in the real world.
Haven't you heard the term "Plug and Pray"? Many products lack the
necessary polish to work "as they should", especially in the Windows world.

And I hate to tell you this, but many computers and peripherals are made in
China, or at least contain components made in China.

Are we just supposed to stop using them?

Even the UV-5R is made in China! Who knows what horrors it might be
downloading into our systems!

As far as Windows root-kit detection goes, there are many AV packages out
there that detect known rootkits: Avast!, Sophos, F-Secure, Microsoft
Sysinternals, among others. Keep them up-to-date and use them as
instructed and you'll be fine. Are they perfect? No, but their use with
sensible computing practices will protect the vast majority of Windows
users.

Again, there's no indication that the Prolific USB cable drivers are
malware.

George

The new shinny surface can be a nuisance and blind our eyes when using the HT on a bright sunny day.

6214. Tone Freq in Baofeng software

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-15 04:17:52 UTC
From: tenorman1952

I couldn't figure out a search term or phrase for this, otherwise I would have used the Search function.

Here goes... when entering a 100 hz TX Tone (CTCSS/DCS Enc column)for one channel it would seemingly enter OK. But as soon as I saved the file, that cell would go blank. Opening the file again, it was still blank.

How do I fix this?

Paul - AE5JU

6215. Serial Programming Cable

This is a very straightforward question. I dont need to know anything about the relative merits/safety of using USB cables as opposed to Serial cables and don't want to start another argument about them. I have read the FAQ and know when my cable is properly seated. I just want to know if this cable as compatible with the UV-5R. The item in question is the Kenwood Programming Cable KPG-22 KPG-4 by Valley, sold on Amazon. I am considering this option because it is the way I WANT to program my radio. And, just for the record, I do have the USB cable and it is working under XP.

"Radio did not ACK first command" is giving me headache

Recently bought a UV-3R+ but have problem connecting to my computer running Win7 via USB.

I didn't encounter error when using Chirp to read and write to my Puxing 777, however I got error when connected to my UV-3R+.
Even though I gave the USB cable extra pushed, it didn't help.

Please help, I'm running out of ideas.

Details:

USB drivers used:
Win7Vista_64bit_ProlificUSB_v3200.exe
PL2303_Prolific_GPS_AllInOne_1013.exe

Chirp version used:
chirp-daily-20120811-installer.exe

No error with USB:
http://farm9.staticflickr.com/8440/7786866580_381b861b8b_b.jpg

Error message: Radio did not ACK first command

Make sure the cable plug is pushed all the way in. With the power off squeeze the radio hard between the plug body and the PTT. You will probably hear a click and the plug will go in another millimeter. Then switch the power on and try again.

Paul,
The Baofeng software definitely has some peculiarities in the way it behaves. This may not be the solution to your problem but I hope it is.

Many times after populating a cell with information and then pressing [Enter] expecting to save it (the natural action to do), I find the information not retained. By trial and error I have found that after entering or selecting the info that you want to be in a particular cell, the best most reliable way to make it 'stick' is to click in another cell.

According to this bullet point on the Amazon website...

Handheld Radio Connector: Kenwood 2-Pin Proprietary (KPG-22)

I would think that it should. The UV-5R has what I call a Kennwood 2-pin spacing and pinout so it accepts speaker mics and such designed to be used with Kenwood HTs.

You might get better help if you asked in a UV-3R group.

It appears from the screen captures that you are all set with your drivers. Especially since you can successfully communicate to your Puxing 777.

If I 'Download from Radio' using CHIRP and leave my UF-5R disconnected, I get the same error. I suspect a cable or connector issue. Does a speaker mic work with the UV-3R+?

Also, I notice on the http://www.importcommunications.com/ website that there is different versions of Baofeng software depending on which of the UV-3R models you have. Maybe CHIRP doesn't accommodate them all. That's where you'd be better off asking in a UV-3R group.
Good luck,
Jim KC9HI

I know nothing about the 777 and very little about the UV-3R+. Do you use the same cable to program both HTs?

Not necessarily, it looks like that, but he said he has TWO drivers loaded. Maybe something is getting confused?

The cables are supposed to be the same. That does not mean a different configuration will work with one and not the other. For example, the ground may be different on your cable.

>
> Also, I notice on the http://www.importcommunications.com/ website that

This is the one to use:

<http://www.uv3r.com/images/UV-3R%20Setup%20v1.11.exe>

It works for all models.

The release of CHIRP works with all of them EXCEPT it will not allow you to have a different PL tone for send and receive. You can have both off, send only, receive only, but they have to be the same tone.

This was fixed in a later release.

There are also comments about the versions and cables in the user section of the CHIRP website. (I know, I contributed them.)

Geoff.

Topic: 6165 Message: 6228

The Difference between the UV5R and UV5RE is the frequency coverage.

VHF: 144 MHz - 146 MHz (Rx / Tx).
UHF: 430 MHz - 440 MHz (Rx / Tx). European UHF/VHF Band Plan

Another Mystery of the UniV5Rse is solved.

John K3NXU

The 409shop specs are incorrect...

FEATURES http://www.pihernz.com/productos/1/773/baofeng-uv5re

- Portable dual band transceiver with display function menu on the display "LCD"
with Lithium-Ion battery with high capacity.
- Ringtones "DTMF".
- Commercial FM radio receiver (65-108 MHz).
- Incorporates 105 codes "DCS" and 50 privacy codes "CTCSS" programmable.
- Function "VOX" (voice activated transmission).
- Alarm function.
- Up to 128 memory channels.
- Broadband (Wide) / close (Narrow), selectable.
- Transmit power high / low selectable.
- Display illumination and programmable keyboard.
- Function "beep" on the keyboard.
- Dual Watch Function "DW".
- Selectable Frequency Hopping 2.5/5/6.25/10/12.5/25 kHz.
- Function "OFFSET" (frequency offset for repeater access).
- Battery saving function "SAVE".
- Timer transmission "TOT" programmable.
- Selecting the Scan Mode.
- Function Busy Channel Lock "BCLO".
- Incorporates scanning function undertones "CTCSS" / code "DCS" reception.
- Flashlight "LED" built.
- Programmable by PC.
- Level Threshold "Squelch" adjustable from 0 to 9.
- Transmission end tone.
- Built-in key lock "LOCK".
- Frequency range: 65 MHz - 108 MHz
(only commercial FM radio reception).
VHF: 144 MHz - 146 MHz (Rx / Tx).
UHF: 430 MHz - 440 MHz (Rx / Tx).

Memory channels: Up to 128 channels.
Frequency stability: 2.5 ppm.
Frequency Hopping: 2.5 kHz / 5 kHz/6.25 kHz/10 kHz/25 kHz kHz/12.5.
Antenna Impedance: 50 ¦¸.

Operating temperature: -20 ¡ã C to +60 ¡ã C.
Power supply: Rechargeable Lithium-Ion mAh 7.4 V/1800.
Standby consumption: ¡Ü 80 mA.
Consumer reception: ¡Ü 380 mA.
Transmit Current: ¡Ü 1.4 A.
Operating Mode: Simplex or half duplex.
Duty cycle: 03/03/54 minutes (Rx / Tx / Standby).
Dimensions: 58 mm x 110 mm x 32 mm.
Weight: 130 g (approximate).

This is a Baofeng software question. Was not using CHIRP.

By trial and error I have found that after entering or selecting the info that you want to be in a particular cell, the best most reliable way to make it 'stick' is to click in another cell.
> Jim KC9HI

Jim, that's what I did (click in other cell) and it appeared to "stick". But when I saved the file, as it was saving the tone disappeared. Upon reopening the file the cell was blank.

This memory file is for another fellow's UV-5R and he lives in another area, different repeaters and such than I have in my UV-5R. I'll be getting it back today to make a few other changes and I'll see if I can put the tone back in, write it to the radio, then read it back, see if the tone wrote correctly to the radio, and then save the file.

This is only in one cell, and I don't see any other problems.

I'll read and write the radio with CHIRP and see what happens, too.

What I found was that if you make changes, you have to save them in an empty memory. So say, if you wanted a different CTCSS tone in Memory 12, you would have to delete memory 12 first and then go back to VFO and go all through every menu option to enable it to save your new selections.

I had some similar problems with Baofeng BF-450 software, which is used for the Baofeng BF-666S, BF-777S and BF-888S radios.

In my case it was an incompatibility with the way we Europeans write down numbers (commas instead of periods and vice versa). After I changed the regional settings to USA and restarted the program, the problem was gone.

If the radio flashes on plug in, it sounds like you have the radio turned on when plugging it in. Mine never works that way (and I would think you can damage these cheap radios doing that). I have to turn the radio off, plug it in, then turn it on, the transfer will not work.

The first radio I got (which later failed) plugged in and worked. The second one was a bitch to get the cable seated right. I had to pound it on the desk pretty hard the first time. Since then it just snaps in place.

I use Linux, so the USB serial driver "just works". The only issue I have run into so far is an over-zealous GPS daemon trying to query the new serial device.

Good luck with the radios.

JH,

Yesterday I conquered exactly that problem with my netbook running XP and my new UV-5R. The solution for me was to open the Windows Device Manager and find the port that is assigned to the Prolific USB-to-serial device. Open the properties for this device, click the Port Settings tab, and change the baud speed to 38400. If this does not work, you might want to experiment with other speeds, since you have a different radio. Make sure that the plug from this converter is all the way into the two phone sockets on the radio.

UV-5R users must make sure that they have the Chirp software that includes the UV-5R; the UV-3R software will not work. Search for "UV-5R daily build" for software that has this update as of now. It is not yet in the generic version. Hint: trac.chirp.danplanet.com/chirp_daily/.

Paul,

Not much help here, although the BF software has its quirks it seems quite solid to use. I would guess that I've reprogrammed 25 - 30 times since April as I traveled from Florida to New Hampshire and found local and distant repeaters.

I have 3 versions of the Baofeng Software including the VIP, which I use mostly. I have tried all three versions and can not duplicate your problem/results.

Possibly a fresh download of the sotware would help? I would save it in a different folder to isolate the versions.

I hope that you keep us informed.

JL

Thanks Geoff.

The two USB drivers were not installed concurrently, I tested them one by one, uninstalled the previous driver before installing the new driver.

The funny thing is, which ever drivers I install, the notebook has no problem communicating with Puxing 777, but it always hang with UV-3R.

There are at least 10 emails regarding this already. It has already
being discussed. *The purpose of an email based group is for the members
to read through the existing emails to see if the question has already
been asked. * You are not supposed to "brain puke" to the list every
little question that pops into your head before reading through the
current threads. It is really, really ridiculous how often this is
happening. The same freaking questions are being answered over and over
again, and in some cases on the same day. I can't believe the ___ load
of email being generated by this list, and almost all of it completely
redundant.

PLEASE:

1. Take a few minutes to look at the current messages to see if your
question has already been asked.
2. Read through all the current messages before "brain puking" to the list.
3. Keep your finger OFF the send button before you have completed 1 & 2

The Difference between the UV5R and UV5RE is the frequency coverage.

VHF: 144 MHz - 146 MHz (Rx / Tx).
UHF: 430 MHz - 440 MHz (Rx / Tx). European UHF/VHF Band Plan

Another Mystery of the UniV5Rse is solved.

BTW: The 409shop specs are incorrect...
The complete correct specs list is in Group post 6228

Hi Meggy...

This has become almost universal and there are rumors the "knock and run" will become an event in the next summer Olympic games. The organizing committee and the rules committees are scheduled to meet next month. They will decide whether to limit participation to government sponsored carriers only, or allow the participation of DHL, UPS, Fedex... etc.

Personally, I'd like to see all carriers involved. We be able to see the "smash and stomp", the "heave and throw", etc

Jimmie

Mike,

The MFJ259 analyzer has two connector interfaces - BNC female and SO259. We had the PL259 to SMA male adapter available which is why we used that connection. Not sure I understand your question. Do you feel having the antenna connected directly to the analyzer via the 259 adapter is in some way altering the readings? We can certainly use a cable from either of the interfaces but I would think that would introduce more loss from the cable itself.

I'm still somewhat of a novice with the test equipment so if there is a better way to do it I am game to try.

Ray

Hi....

I haven't run into a root kit problem in a couple of years. However, I've learned to check my system over very couple of weeks to rid myself of any "infections". This is what I currently run on 4 machines.. its kept me free of problems. All the programs are the "free" versions...

Avast, Malwarebytes, and Spybot.... Avast is a full time monitor, while the latter two must be run. My "network" also has a Netgear router with firewall. You should also have a known good backup of your computers operating system and files; update it every couple of weeks on a "A - B" schedule. That should be good enough for home use.
If you have files that are irreplaceable, then get another backup to a different media, like dvd or flashdrive. I always backup my wifes hard disk to a large flashdrive; she has 10 years of genealogical research on it. So for her computer its external hard drive on a A:B
schedule, then flashdrive. Its like wearing suspenders, a belt, and stapling your trouser to your shirt to make sure your pants don't fall down... redundant, but effective.

Michael is right. Many computer problems are caused by manufacturers disks that have been modified by disgruntled employees. A rootkit problem on your computer is a bad thing to have happen; it attacks your operating system and attaches itself at the lowest levels.

Jimmie

Ray,

From my limited experience (68yrs), you should test things the way you plan to use them and not introduce anything that may cloud your findings. Of course in the field of LCRs perhaps this would be different.

I would think that testing an antenna using different methods from which you operate would only give you the potential results and not the real results that you would get with your own actual setup.

OK, got the USB cable from China today. Plugged in UV-5R, installed chirp-daily-20120811-win32. Program runs but as I've already programmed 60 memories by hand, I don't want to lose those.

How do you know if the computer is seeing the radio? The red tx light comes on full, then pulses nine times, the display lights up for about 90 seconds and then goes out. Pushed the connector hard in.

Installed USB Driver for Vista & Win7.exe

Double click on chirpw.exe, launches, click on Radio>Download from radio - nothing. What should happen?

Just see a blank Chirp window apart from the text at the bottom
[0] Completed Getting Memory 25 9idle)"

Any clues?
Thanks

Extract:

For multi-radio devices the isolation between antenna elements plays a very important role, as

isolation between antennas should be kept as high as possible. In modern 4G applications that

might include multiple antennas operating on the same frequency ranges (MIMO), the

correlation between antenna elements should be minimized. Antenna correlation can be

calculated using the data gathered from antenna efficiency measurements. With mobile devices

that have a human operator a specific absorption rate (SAR) is determined to measure the rate

at which energy is absorbed by the user’s body when exposed to an electromagnetic field. SAR

measurements are performed by authorized test laboratories equipped with special devices and

knowledge for these highly controlled measurements.

Are you able to measure the SWR with their antenna mounted on a plate to remove the 259 as part of the antenna system and then a cable to the MFJ259? Would that not accurately determine the resonance of the antenna.

Subject: [baofeng_uv5r] First time using Chirp

OK, got the USB cable from China today. Plugged in UV-5R, installed chirp-daily-20120811-win32. Program runs but as I've already programmed 60 memories by hand, I don't want to lose those.

How do you know if the computer is seeing the radio? The red tx light comes on full, then pulses nine times, the display lights up for about 90 seconds and then goes out. Pushed the connector hard in.

Installed USB Driver for Vista & Win7.exe

Double click on chirpw.exe, launches, click on Radio>Download from radio - nothing. What should happen?

Just see a blank Chirp window apart from the text at the bottom
[0] Completed Getting Memory 25 9idle)"

Any clues?
Thanks

Agreed but nothing happens. I don't think the computer is seeing the radio. The USB lead says it's for the UV-5R.

http://www.ebay.co.uk/itm/180941798965?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

I've got a feeling it's to do with drivers and ports but I can't find it in Device manager, wonder what it should show up as?
This is a 64bit computer if that makes a difference.

If you can't see the adapter in the device manager, then the application
can't see the radio.

Check the notes in the files section. Lots of discussion on this.

A window should pop up asking you for your Radio model and COM port. Once you select the appropriate items and click the OK button the window should switch to say "Cloning" with a progress bar. Once that is done your radios information should appear in a "spreadsheet like" format in the Chirp window.

Attachments: 1 described; binary payloads are missing from this source WARC

I saw another variant of UV-5R. Its UV-5RA. Also cosmetically different but this one nice looking.

408Shop answered my email. They claim the only difference is cosmetic.
"UV-5R and UV-5RE have same functions, just outward appearance is
different"
So, they did not add much to the conversation other than what you found.

> JL

OK, here's what I've done...

Hooked up the radio, opened the Baofeng software, typed the 100 hz tone into the blank, wrote to the radio. As it wrote the 100 disappeared.

I read the radio back to the software, that same cell was blank. Hmmm.

Then I shut down the Boafeng software, opened CHIRP and read the radio.

NOW CHIRP shows that tone and the Tone encoding is active. The 100 hz tone is present for that channel.

So, apparently it IS in the radio, just that the cells is "invisible".

Hah! Strange.

Hmmm...
To start with, Remove the battery for about 15 seconds, then replace.

To take the radio back to factory settings, (wipe out everything)
Turn the radio for a fresh start and press:
Menu, 4 0, Menu, Menu

Do you see anything at that point?

6278. SWR and the 3.79 antenna.... was Antenna Observations UV-5R (LONG)

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-15 21:07:22 UTC
From: Jim
Topic: 5819 Message: 6278

Hi,

I have refrained from writing this reply, but decided that the subject needs to be broached. The UV5R group is a worldwide meeting of diverse peoples and different interests. Some are radio experts, with others not so much, and may need a little direction.

The SWR of any given antenna is a very poor predictor of its performance. In years past, no one even bothered to measure it because the loss in the feed systems was very low, even with "high" SWR values. It was only after the almost universal adoption of coaxial cable that it became "important" to some people.

In the case of a handheld radio, we could get two "perfect" resistors that would measure a "perfect" 1:1 swr on both bands. Would this indicate a fantastic antenna? No, of course not... just a good match to some resistors. Would it radiate well with this perfect 1:1 swr? No! Radiation pattern and field strength would be very poor!

Every problem has a "chart" somewhere, and swr is no exception. Usually it shows graphs of swr vs loss in the length of the transmission line. In the case of the a handheld radio.. WHAT TRANSMISSION LINE? Where is it? Is there a transmission line in the conventional way, or is everything microstrip construction? What would be the loss 2cm away from the final with a 6:1 swr? Could even the designer answer that question?

Walt Maxell, W2DU, passed away earlier this year at age 93. Before retirement he designed antenna systems for satellites and authored a very famous series for QST magazine, a monthly publication of the ARRL. The series became the basis of a book named "Reflections", and it went through a couple of revisions. Several chapters of "Reflections 2" are available for free from his old web pages at .....

http://w2du.com/

I urge you to either download, for later use, or read the first few chapters. How long the site will remain is uncertain. It doesn't take him long to lay bare the myths of low swr and antenna efficiency.
"Better to light a candle than curse the darkness".

6279. Re: UV-5RE new version???

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

Howdy Ray ----
After reading your note below, I went to the www.409shop.com site and snooped around a bit. What was interesting was....I zeroed in on their product page for the NEW UV-5RE. Then, looking at the detail photos of the OPEN radio backside where the label is placed (battery removed shot) note three things....

1. The part number is correct (UV-5RE)

2. The frequency ranges are the SAME as the original design label.

3. The serialization scheme reflects a new product.

Unless they were working real hard to create a "phony" product representation, there is a good chance that what the 409shop said is true, at least for the version they are selling on their site.

I have sent an email to their customer service to again poll them about this particular radio.... :-)

Cheers, Bob K6WL

What do you mean by 'installed USB drivers'? If you didn't go into device manager and select it, then it isn't fully installed. Read the guide at the website on the group home page.

Prezados Amigos: estou com 02 HTs Baofengs, UV-5R, que ao recebe-los, estavam perfeitos em todos os detalhes, sobretudo em suas transmissões.

Depois, ao manusear as teclas e menus, os 02 HTs deixaram de transmitir através de suas teclas.

Eles transmitem normalmente usando PTTs externos, mas através das teclas não transmitem absolutamente nada, e também não mostram nada em seus displays.

Estou solicitando ajuda, socorro, help, à todos os amigos que já conhecem melhor estes aparelhos.

Quase tudo já foi feito sem nenhum resultado positivo.

Os HTs continuam sem transmissão, seja la a frequencia que estiverem.

Já foi feito reset(menu 40) por várias vezes; já foi colocado o VOX na posição OFF, enfim . . . . . ja tentamos de tudo sem nenhum resultado positivo.

Por favor, solicito-lhes Help . . . . . .

Help, Help, Help, Please . . . . . .

Muito Obrigado.

Antonio

>CTCSS TONE SCANNING (to unlock hidden conversations).

Two things...

1. This is not a new feature. It works for both CTCSS and DCS.

2. You would turn _OFF_ R-CTCSS and R-DCS "to unlock hidden conversations." LOL

Topic: 6289 Message: 6289

Hello all,

I'm sure this subject has been beaten to death too, but I'm new here and have not read too many postings.

I bought this little radio months ago, literally, and gave up in frustration with trying to use the repeaters.

Today I did some more researching and found a post that advised me to reset back to factory default settings. After doing this, it all seemed to fall into place, the postings, the youtube videos, etc, and it worked for the first time - today.

The advice online seems simple - NOW - and I'm not sure if it was just co-incidental, but the reset seemed to work for me.

Anyone else get stuck on this and figured it out?

Thanks,
dg

Any TNC will work. You'll have to connect the GPS to the TNC like a KPC-3.

The UV5R will be an easy interface as you have separate lines for Ground, PTT, Audio in and Audio out. You won't have to use the handheld setting in the KPC3.

Argent Data has many like: http://www.argentdata.com/products/tracker3.html and they have an entire forum to discuss these as well. Just treat your handheld like a Kenwood handheld as the interface is the same.

They even have GPS's for it. I have used them all with great success.

6292. Deleting Phantom serial ports

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-16 01:07:15 UTC
From: Michael Walker
Topic: 6292 Message: 6292

No, as you need to set the environment variable first to see the phantom'd ports.

set devmgr_show_nonpresent_devices=1 and hit ENTER

It is then set for the 'dos' session and you then also have to start device manager from that session in order to have the environment variable recognized. If you don't do that step, they won't be displayed.

It would make sense if that environment variable was set in the global settings. Something you can do. (I should do that some time). :)

6296. Re: SWR and the 3.79 antenna.... was Antenna Observations UV-5R (LONG)

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-16 01:46:30 UTC
From: aggieoutlaw
Topic: 5819 Message: 6296

I understand your point. A good SWR does not mean you'll get any performance out of an antenna.

However, a bad SWR (6:1) is a very good indication that your antenna is very poorly matched at that frequency and will not efficiently transmit power (which is the whole point).

People use SWR as a metric because it's very easy to measure. Making calibrated antenna pattern measurements at and below VHF is very difficult to do.

SWR is not the end all be all of RF systems, but it should not be dismissed.

Cheers,
-Brad

From: Michael Walker
Topic: 5819 Message: 6297

Walt's book is required reading for any ham.

I like the part where he talks about the Satellite antennas and how their best SWR is 9:1. :)

From: Jim
Topic: 6289 Message: 6298

I assume that you were doing your programming via the HT keybad. Just taking a SWAG, I'd say you inadvertently had an R-CTCSS value set in menu 11. It is easy to get the R-CTCS and T-CTCS menus backwards. If you have the UV-5R monitoring for a CTCSS tone and the station you are listening to isn't transmitting one, you will hear nothing. Doing a Menu 40|RESET|ALL will set Menu 11 back to OFF.
But just a guess.

Right again John. What they found was a .dat file (useable with the Baofeng software) already programmed with the 80 channels in the files area of this group.

6301. Re: UV-5RE new version??? (Email Reply from 409Shop.com)

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-16 02:25:55 UTC
From: apollomaker
Topic: 6165 Message: 6301

OK Ray, and All ----
I received a reply from www.409shop.com to my questions which reflected my interest in the new UV-5RE. Here is what they said (paraphrased).

1. The frequency range CAPABILITY is the same as the present UV-5R model. There have been no changes.

2. The -5RE model is in stock ready for orders.

3. Their shop is not yet stocking the 3600 mAHr battery yet, but it can be procured elsewhere if desired.

The 409shop was fast to respond, especially if you register with their site. Good communicators.

Cheers --- Bob K6WL

6302. The downside of ordering from China

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-16 02:34:45 UTC
From: Alek Kristola
Topic: 6302 Message: 6302

Got my second UV-5R today, the model that comes with the 3600 mAH battery. Still version 231 like my other one, but not a deal breaker.

The PTT button not working is kinda annoying. Connecting a mic allows me to transmit. Knowing I'd bend over on shipping for warranty work, I decided to crack her open and see what was up.

The internal PTT button module solder points broke off the board. So now I get to practice some soldering. I'm choosing between trying a direct connection or using jumper wire and then super glue to keep it in place. I'm leaning towards super glue.

Anyway. A reason to buy from country of residence. Unless, you're not bothered by tinkering. I'm actually looking forward to making this radio work 100%. If I fail, this radio is turning into my dedicated car radio with speaker mic. Not the end of the world.

Also, while I have this cracked open, anyone have some suggestions on potential internal mods? I know there is a audio TX mod that I'd been hesitant to try because I didn't want to open the radio. But since I'm already here...well...why not?

I might also try to finagle a way to swap out the SMA connector for a BNC for the antenna. Eliminating an adapter would be nice.

I had to open mine up too when I got it,... promptly voided any warranty I might have had with China, because I was not about to ship it back for the money involved.
In my case the lower two keypad LEDs did not work. So I ran thin wires from the two working ones down to surface mount replacements to connect them in parallel. Problem solved.
Two suggestions: 1. While you're in there anyway, make sure the mic hole is open or drill it out from the inside to make it open. (Many posts about that being a problem in these units.)
2. When you go to re-assemble, slip a thin piece of plastic (like a piece of overhead transparency or similar) in to hold the PTT and nearby buttons at bay while you slip the unit back into the case. Then you can pull the plastic out and the buttons will not be scrunched up at a funny angle.
Good luck,Ian--- On Wed, 8/15/12, Alek Kristola <akristola@...> wrote:

Alek,

My only request would be for lots of good pics. I would be interested in the inside case near mic hole and any and all detail inside. I have seen some pics on our Group site and on Youtube but they are too small and low resolution for my taste.

So a couple of Hi-res closeups would earn you a cup of Joe and a donut if I ever get to eyeball ya!

A description of dis-assembly and re-assembly tricks and or problems would be a good thing for the File area too.

Good luck with the repair.

Since the radio only costs $50, I ordered a bunch. Out of the 10 that 8 people wanted, 1 was a dud. We just dialed that into the cost.

It is certainly a 'you get what you pay for' issue.

I know they are pretty good about fixing things. Sadly, you just have to send it back.

Mark

What com port are you using? I want to make sure that you are using the number you think you are using.

Go into device manager. While watching the Serial ports, plug and unplug the USB cable. You will (should) see 1 of them appear and disappear..

As far as I know the file that you found will only work with the Baofeng software and again as far as I know it is because the Chirp software has automatic offsets for the HAM freqs which are different from the UHF CB offsets and that cannot be changed in Chirp.

For those interested, I just received more information from www.409shop.com about the new UV-5RE and present UV-5R.
They told me that their present UV-5R, the current model, is all firmware version BFB251. The new UV-5RE is version BFB281 which I have no details on. I have ordered two of the new units. We will see what we get :-)

Hi John,
I've uploaded 3 pictures from the device recently in to the Files folder. Perhaps they are useful for you.

From what I read in the group, most times you only have to send back the defective part (in this case just the HT), is costs about $8 to ship it back and it takes about a month to receive the replacement.

CHIRP easily handles off offsets like the ones needed for the Australian UHF CB repeaters. One could untick 'Automatic Repeater Offset' but CHIRP will still let you change it after it make a suggestion.

It was a simple matter to upload the .dat into my UV-5R and then download them into CHIRP. I exported the 80 channels to a .csv file instead of a CHIRP .img (to keep from overwriting another UV-5R with my power-on message and my custom [6] key + power-on message) and uploaded them to the file area of the group.
Jim KC9HI

True that the .dat file is for the Baofeng software.

CHIRP handles

Hi Jim,

Yes I was using the keypad.

Thanks for the reply, you are probably correct in what you're saying.
Perhaps I should invest in software to program it by the computer,
rather than the keypad. I'm sure it makes things a lot easier.

Can you or anyone else recommend software that works OK with the USB
programming cable? Does it need to be 32 bit or will it work with
Windows 7 64 bit?

Thanks!

Yes, it can be a pain at first ;)

That's why I posted about the procedure on my blog in April.

http://hamgear.wordpress.com/2012/04/07/setting-up-and-programming-your-uv-5r/

That seemed to help first timers a lot.

I have the Baofeng BF5R & BF5R VIP and the CHIRP software installed on my Windows 7 64-bit PC. They all work fine (within the limits of their individual quirkiness, the Baofeng software more than CHIRP).

The Baofeng software is available from the files area of this group. CHIRP is available from the developer's website. Be sure to get a more recent Daily Build (the release/stable version doesn't have UV-5R support). A link to the daily builds can be found at the website mentioned on the home page of this group.

The software is free. Baofeng provides a specialized program just for the UV-5R for free. You can find it here in the files section, search previous messages for which one to download.

CHIRP, which is FREE software, (as in open source and no charge) has been modified by the author to support the UV-5R. The last release does not support it, but you can download a "daily build" to get a version with support.

Both do similar, but not the same things. Most hams will want to have both. CHIRP was written by a ham for hams, so it may be more comfortable for you.

They both work fine with USB programing cables, using Windows x86 (32bit) or X64 (64 bit). Windows itself has issues with the various cheap cables on the market, so look back in the archive for instructions on how to install the drivers and do it to the letter.

To give you a heads up the problems are due to Chinese manufactures making almost compatible USB to serial bridge chips using Prolific brand drivers. Prolific found out and now their drivers will only support real Prolific chips, which no one seems to be able to find in a cable.

You can avoid this by buying a cable with a real Prolific bridge chip in it, or a different manufacturer's bridge chip.

The $64,000 question, as it were, is who sells them.

You can also avoid it if your computer has a real DB-9 type serial port on the motherboard or in an expansion slot and using a DB-9 to radio cable, which has an RS-232 to TTL bridge chip (which uses no drivers).

Some people also have had good luck by buying a USB to DB-9 serial port adapter built with a supported chip, and then a DB-9 to radio cable.

The eBay vendors are starting to wise up and now list their cables as working with Windows 2000, XP and VISTA, but do not say they work with Windows 7 (nor Windows 8).

Save yourself a lot of trouble by making sure you get the correct cable and read and follow the instructions for installing it (and after installation).

BTW, this is NOT a UV-5R problem, it is a Windows problem and affects any radio that is programmed with a USB serial cable.

Geoff.

Let's try another approach.
When the battery is in the charger, does the LED change from flashing
red/green to solid red, then go to green when fully charged?

Turn the radio on while in the charger.
Does the display show up then?

Just trying to rule out a dead battery and/or bad charger possibility.

Hi Steve,

If you installed the Baofeng software into the default location (where mine is) it goes in the following directory

C:\Program Files\5R_CPS\ "put *.dat file here" and then browse to it from the software..

Cheers,

Rob.

I hate to say it Tio, but you might have to write that radio off or send it back. No one else has been chasing a problem like this.

That operation is not normal and is likely a cold solder joint inside the radio.

When the radio heats up (even slightly) it freezes. Just for fun, try cooling the radio off by putting it in a freezer and see what happens.

If you open it up, you might be able to find a cold solder joint, or even go over it with a 're-work' station if you have one.

Or, you might just call it a dude and spend $52 to order a new one. Just be glad it wasn't a $450 Icom DSTAR radio. :)

I hate to say it Tio, but you might have to write that radio off or send it back. No one else has been chasing a problem like this.

That operation is not normal and is likely a cold solder joint inside the radio.

When the radio heats up (even slightly) it freezes. Just for fun, try cooling the radio off by putting it in a freezer and see what happens.

If you open it up, you might be able to find a cold solder joint, or even go over it with a 're-work' station if you have one.

Or, you might just call it a dude and spend $52 to order a new one. Just be glad it wasn't a $450 Icom DSTAR radio. :)

I guess it doesn't cost much to send it back. Might be time to pack it up.

Our friend Antonio from Brazil asked for some help translating his help request.
Maybe some of you can help. TIA

Here it goes:

"Help. . . Help. . . . Dear Friends, Baofeng UV-5R users: I have 02 brand new HTs UV5R, who were working very well.

I believe that, after much fiddling with buttons and menus, I may have turned on some strange function that blocks the transmission.

Strangely, the radios transmit normally using an external PTT.

Using the radio PTT button, it does NOT transmit, whatever the frequency is in use.

___ I think we've tried everything, with no positive result.

___ If anyone knows the way to unlock these devices, I leave here, in advance, my sincere thanks.

___ Antonio - Limerick - SP - Brazil.

Alek, would you mind taking some high resolution macro photos of the board and internal construction? I'm slightly averse to cracking open my radio without an actual need, though I'm interested to see what's inside. Much obliged.

Oh boy. Maybe attempting repair with surface mount was a little optimistic. Not as easy as it looks. I have two points down good, but the component has next to nothing on the other side to work with. Tried jumper cables, almost had it but the wire heated enough to undo the other end. Will take pictures of what I can.

I found that if you have a speaker/mic plugged in to the radio, the radio PTT button will put the radio into transmit mode, but it will not transmit any audio at all (from the internal or external mic).

If the radio will not transmit audio without anything plugged in, then the jack is likely stuck open. There might be a piece of debris in the jack.

Let's try another approach.
When the battery is in the charger, does the LED change from flashing
red/green to solid red, then go to green when fully charged?

Turn the radio on while in the charger.
Does the display show up then?

Just trying to rule out a dead battery and/or bad charger possibility.

I have just locked up my unit using the # key in the LR corner of the keypad. It locked ALL buttons except the Monitor and the Help the first time. My external spkr/mic worked, the side PTT did not. Successive on/off of the # key did not produce the original result as the PTT worked.

I would suggest (1) Press and hold the # Key for several seconds. If you have voice on you will hear something that sounds like "unlocked".

Try your unit to see if there are changes. If not then

(2) Reset all using Menu 40

Peter may have the answer, some folks have had some left over stuff from manufacturing that may get between contacts causing this issue. It has been dealt with by using compress air and repeated insertions/removals of the spkr/mic. My previous answer was addressing a locked keyboard.

I found that if you have a speaker/mic plugged in to the radio, the radio PTT button will put the radio into transmit mode, but it will not transmit any audio at all (from the internal or external mic).

If the radio will not transmit audio without anything plugged in, then the jack is likely stuck open. There might be a piece of debris in the jack.

My Baofeng software is not from the CD with the radio. It was downloaded from this site. I have both the regular and the VIP. Both react the same way.

My CHIRP is the latest "daily build" downloaded just a few days ago.

Is there a possibility that the software requires "100.0" instead of "100"?

I don't use this software but have seen similar instances in other cases.

Paul,
What version is your Baofeng software? I'm using v12.03.06 and VIP v12.03.04 and I can't duplicate this behavior.

This is starting to sound like a Visual Basic issue. Which file did you download and install? I would try one that includes the VB runtime files (if the file size is more them 2,000K (2M) then it should have them. I installed "UV_5R_P 20120425.rar" from the files area. It has the runtime files. Then I installed "BF5R_VIP_CPS.rar" afterward. It doesn't have them.

OK... From what Mike and Jim said about the variable, it must already be set to "1" on the Win XP systems I tried, because the option "Show Hidden Devices" in the "View" section of Device Manager is already there.

If it wasn't set to "1", I would then not see the "Hidden Devices" option and would use the procedure you given me earlier. Is that correct?

The 4 computers in the home network allow everyone administrator privileges. Any "connection" there?

Unfortunately I think it is the nature of this HT. I have the same issue when I have my UV-5R at on my desk at work. I discovered that if I set the HT with it's back right next to the case it mostly takes care of it. When it does act up I can usually put my hand up near the antenna for a few seconds and it quiets down. Fortunately I listen to a UHF repeater so I can set the squelch all the way up to 9 as well.

The document "UV-5R_tech_discussion_fixes.pdf" in the files area discussed this problem and describes a fix. Unfortunately it requires opening up the HT and adding a resister. I doesn't bother me enough yet to try this out.

The tone decoder for the CTCSS or PL tone is actually decoding the required tone from the white computer noise.

Some CTCSS decoders will decode for a longer period of time before turning on the audio amplifier and the speaker. However, this is at the risk of loosing some normal audio dialogue.

It has nothing to do with the receiver being swamped by a strong signal as it is not at the RF end of the radio. It is at the AF end.

CTCSS or PL (private line) works by decoding or rectifying the sub audible tone on the transmitted signal with a very tight filter (more likely phase detection). Once it determines that the signal has a valid tone (you can sometimes hear the hum of the tone if you listen closely), it will then turn on the Audio amplifier of the radio and then you here the signal. No valid CTCSS tone, no audio.

What is key is... it is a $50 radio and is not designed with the same specs as a $500 Motorola commercial hand held and all the extra circuitry that is part of a commercial radio. Short story. It is working as designed. Get used to it having many things that sort of work. :) The specs are hugely different.

Yep, it is just their nature. I have run a bunch of tests with various RFI sources to confirm and yes, the "little guy" is quite vulnerable to computer hash in particular. I just relocate the HTs and that seems to work pretty well. Can't have it all for $50 :-)

Topic: 5819 Message: 6355

Hi Brad,

Reflected power is just that.. reflected back to the source, which reflects it back to antenna. With a total loss-less transmission line, all reflected power would eventually be radiated. The only losses occur in the "transmission line".

If we were operating on hf with the old large size open wire transmission line, our swr losses would be very low. It was not uncommon for the old stations to have 10 to 1, or higher standing wave ratios, and still radiate 90% of their signal.

Walt talks about high swr satellite antennas that still radiated 90% of the signal... little to no loss in the "transmission line".

So, the best way to characterize an antenna for our handheld would be to look at field strength measurements.

SWR losses do not occur in the antenna, or the final amplifier, they occur by traveling back and forth as reflected power in the transmission line.

Presuming our UV-5Rs actually have a regular transmission line, go to this page and make some calculations....

http://www.arrg.us/pages/Loss-Calc.htm

I used rg58, which is pure insanity at these frequencies, with an swr of 10:1, and a length of 3 inches. Total loss for that poor coax and high swr was 0.09db. That is totally inconsequential because the calculated efficiency is 97%.

It would probably be hard to measure a small loss like that, let alone "hear" it.

We need to test the directly attached antennas and handheld radio as a "system" to ascertain its transmitting efficiency. From that, we could infer that reception efficiency was similar. To me, the easiest thing would be measurement of transmitted signal strength in the Far-field.

73, Jimmie, K9JFK

Let's have some fun today!

This is not a problem with just the UV-5R. This happens on my Yaesu FT-60 (about 3x the cost) as well. As soon as I walk in the door at home, my radio will light up from RF sources in the house on certain local 2 meter repeater freqs. Setting up CTCSS encode and decode made the radio quiet. But that is not always an option as a lot of repeaters don't use CTCSS on the receive side. In my case it does work on my UV-5R, but the little receive LED is constantly fluttering when at home.

FCC part 90, etc means you have the double edge sword of not being allowed to generate interference, but you must also accept any interference you receive.

A nice little side project could be building your own yagi (fox hunt) antenna to attach to the UV-5R and then you can try to hunt down the source in the house. Or, you can simply go around unplugging things until it goes away and then see what you can do to remedy the interference. In my case it is the Linksys wireless router that is making all the RF noise in my house.

The RHA-771 antenna:
There are three models, the female sma, and male sma, or BNC.
The whip length is 16.5"
It'a 1/4 wave.
Gain is 2.15 in the 440 band.
Ordered late 08/13/2012 arrived in 92223 08/16/2012 2:30 PM local deliv.
Do I believe it's worth the 19 bucks with Shipping? Yes absolutly.
The item can had from ebay.
I saw no rating for gain on 2meter, but hearing is believing.
Do I recomend this antenna? yes, buy it!
This huge antenna does not tip over the uv5r even with the long length when it is sitting on a level surface.

I have the tone squelch activated for repeaters that do generate a pl tone on TX and I still have lan/computer trash unsquelch the receiver randomly. It should not happen unless there is the exact tone being generated from a transmitter. I have had others listen to the same frequencies and their radios stay quiet. My friend has a Baofeng UV-5R as well and it does the same thing. Any one have any ideas as to the solution?
Thanks.

Topic: 6346 Message: 6362

There is some truth to what we have paid for this radio ($50). I do not yet have it figured all out but, this radio can not be made, sold to a wholesaler, e-Bay and Pay-Pal fees paid and free shipping for only $50. When you know that shipping is $10, eBay & PayPal $3-$5 that's an awful lot to expect for $35 in today's markets.

By the way, I own 2 of these and one or the other sits on a stand within 6" of my Toshiba laptop with no effects at all. On the other hand when my wife has the convection oven going I loose my Internet connection through my bridge and/or router..... LCR still functions.

Ya gotta love it.

JL

Não os botões de trabalhar na parte da frente do rádio?

É o único problema que você deve usar o alto-falante externo / microfone para transmitir?

Follow up... I can read the radio with CHIRP, see that everything is set correctly as far as tone. I can write back to the radio with CHIRP.

Then read from the radio in either the regular Baofeng software, or the VIP version, and that one cell, in my case, line 15, appears blank, either reading from the radio, or opening the saved file.

So, no resolution to this problem. What I will do is stick with CHIRP.

73,
Paul - AE5JU

6368. Re: Radio hears computer/lan noise even when tone squelched

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-17 02:51:16 UTC
From: frankpasta
Topic: 6346 Message: 6368

Your problem is not the uv-5r:
I have the uv5r 21" from my computer and 25" from my monitor and a new flat screen. The audio from the uv5r is driving a 15 watt amp through two small 5" speakers. My uv5r not is not recieving any distortion of of any type. I am sure that by prosess of elimination you should be able to narrow this down an eliminate the problem.
Easy suggestion :
Take the radio to another computer somewhere, then see what happens and go from there.>>>>KJ6KHF Frank

Antonio

Há um outro membro que tenha o mesmo tipo de problema e corrigi-lo é ele mesmo.

É uma questão de garantia, como o rádio deve ser aberto para corrigir.

Vou mantê-lo informado sobre a sua reparação, mas que poderia ser melhor para retornar a sua rádio para a troca.

Eu estou usando um tradutor automático para fazer isso por favor erros perdão de mim.

John

> This is starting to sound like a Visual Basic issue. Which file did you download and install? I would try one that includes the VB runtime files (if the file size is more them 2,000K (2M) then it should have them. I installed "UV_5R_P 20120425.rar" from the files area. It has the runtime files. Then I installed "BF5R_VIP_CPS.rar" afterward. It doesn't have them.
> Jim KC9HI
>

The regular Baofeng UV-5R software is v12.03.06, same as yours.

The VIP is v12.03.04, again, same as yours.

It should not happen unless there is the exact tone being generated from a transmitter. I have had others listen to the same frequencies and their radios stay quiet. My friend has a Baofeng UV-5R as well and it does the same thing. Any one have any ideas as to the solution?

Dear John,

The UV-5RE are the same specification as UV-5R.You can check detail from attachments .

Sorry for that we don't sell this model so far . Could you kindly check our model UV-5RA and UV-5RC instead ?All of them are in the same function ,but only difference on appearance.Hope you will like .

I am waiting for yr response!

Best regards

Baofeng Support,

Could you e-mail me the specifications for the UV-5RE please?

Thank you,

John

Antonio

Tem sido um prazer para tentar ajudar e eu não gosto de ajudar.

Este UV-5R é uma rádio muito boa, eu acho. Nós temos 2.400 membros em nosso grupo e tão pouco os problemas reais, apenas em como fazer as coisas por isso é muito ruim que você tem um erro.

Mantenha-me informado sobre a sua reparação ou substituição.

Tome cuidado,

John

Ok. John,

Obrigado.

Tomarei todo cuidado e o manterei sempre informado do andamento das pesquisas e tentativas que continuaremos fazendo por aqui, com o objetivo de resolver este desagradável problema.

Muito obrigado, uma vez mais.

Antonio.

then, the only benefit of 5RE is that you are getting the most recent (281) firmware.

I just ordered one on 409shop - will report when it comes in.

From: MichaelB
Topic: 6346 Message: 6377

On the odd chance that there might be a software glitch going on inside this little gem, I decided to do a full reset. Menu item #40.
Reloaded my memories and did my preliminary test.
NO OPEN SQUELCH issues when in Tone Squelch. No more noise bursts in receive when in tone squelch.
Problem solved.

Thanks for everyone's suggestions.

Yes, it is only a $46.80 radio. But it still wasn't performing according to its design specs. NOW it is.

Best 72, 73 to all.
Mike Baker K7DD

Hello John and All ---

Well, I just received notice that my two units of Baofeng UV-5RE have just shipped from Hong Kong (409shop.com). Just going to have to wait and see what shows up :-) I may have more details tomorrow.

6379. No voice, only pick up squelch noise from repeater?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-17 06:21:21 UTC

I set up two HT radio to link up to our local repeater. Everytime when I press PTT to talk, the other receiving HT radio, I can only hear squelch noise but not my voice. Even I disabled the tone code (203.5Hz), it didn't help.

What is wrong with my repeater settings. Attached are the details.

Details

Repeater settings

Michael,
Thanks for reporting back your solution. Did you use the Boafeng or CHIRP software to reload your memories?

Settings look fine to me too. Are you sure you're not just overloading the receiver of the other HT?

The repeater setting shown in CHIRP looks OK to me. My guess is that everything is fine.

Transmitting unit is likely overpowering the receiver in the receiving unit because of their close proximity to each other. This isn't unusual.

Get someone to help and try this. Put both HTs on the repeater channel. Tap the [* SCAN] key on only 1 HT (this will swap its RX and TX frequencies). Now separate the HTs by a room or two and see if you can talk back and fourth. There should be no problem if they are setup correctly. Tap the [* SCAN] key on the same HT as before to unswap its RX and TX frequencies.

You might repeat this test swapping the RX and TX of the other HT. This should work as well.

If all went well, have the second person take one HT and put some distance between you and your HT. Now do your repeater test as before while the other person monitors. Let us know how it turns out.

You are desensing the other radio. Move it further away (a few hundred meters).

Just to say I've got the same problems, Tried Win7 64 bit, Win32 bit, XP, At best I get to the Com dialog but then only offered Com 1 or 2. Radio Tx red LED comes on steady for a few seconds, flashes nine times, display LED comes on.

Then the CHIRP error windows shows "Radio did not respond" after 'Download from Radio' Connector checked, earphone/mic works OK.

The only thing I can think of now is what used to work, now doesn't. Radio only a couple of weeks old, new cable. Maybe something changed?

Someone cleverer than me will have to sort this out.

6387. USB cable test?

Does anyone else suffer from this problem when using CHIRP:
You click on a row you want to delete, and choose "Delete and move up".
Doing this takes everything out. Even the rows and columns (i.e. a white page). And waiting in hopes it will come back where it should, it never does. You exit out and find that you have to use the task manager to close it out.

Thanks

Robert

You might want to search the CHIRP users group. You can also submit a bug
on their support page.

Bingo, you are absolutely right, both HT are too near to each other, after I moved to a separate room, the other HT can hear my voice.

But the squelch noise is too quite noisy even when set to "9", is this normal, or is it limitation of my stock antenna?

Hi...

Google has a number of great features, and one of them is to search for images only.

Put the search terms into the Google box.

Click on "Images" on the left.

Lots of images will come up, most useless. Clicking on the interesting ones will get you to the web pages that originated the image.

You might want to vary the terms, like "UR5R PCB", or "UV5R internal", ... you get the idea.

There are a number of good internal images of the UV5R available... not comprehensive, but available.

Jimmie

I have been trying to keep up with the messages, and I have not seen an answer yet. Please forgive me if someone has already answered your question satisfactorily.

If both radios are in the same room, this is normal. The transmitted signal is DESENSING or overpowering the receiver in the other radio.

For example: if the radio is transmitting on 146.340 and receiving on 146.940, the nearby signal on 146.340 is too strong for the other radio to be able to receive on 146.940.

If one of those people will walk outside, or across the parking lot, or a half-block away, then this problem will decrease. If the second radio is three blocks apart, you will hear the repeater perfectly, because the desense is no longer an issue.

If you were using SIMPLEX, that is, transmitting and receiving on the same frequency (for example: 146.520 MHz), then this would not be an issue.

I hope that I have explained this in an understandable manner.

From: richard.briant@btinternet.com
Topic: 6402 Message: 6402

I have an odd problem.

Radio number 1 was functioning correctly untill programmed with the Wales .dat file(modded).
I added 2 PMR CTSS channels as there is a parrot rptr in my locality that's handy for signal testing.
After programming no TX was heard using internal mike.

Contacted supplier, who kindly supplied me with another, free and as compensation.

I tested this , it worked,..

Radio number 2 was then programed with the same data, guess what...

yup.. no internal mic.

This was then re tested with a plug in PMR mic that I have, now it works fine.

BUT THATS NOT ALL...

In the interim period i purchased another UV5R, and used it in frequency mode/channel mode(with the wales.dat (IN ITS ORIGIONAL FORM). great finaly one that works properly...!

UNTILL... yup.. I went and uploaded the wales.dat(modded) and hey presto...
NO INTERNAL MIC.

the only common thing here, apart from the .dat file is that Id set channel 0 to contain data.

when channel 0 did not contain data there was no fault.

I have tried the menu 40 reset but this does not help, still no internal mic.

If anyone has any ideas at this point Id like to hear them.

OHH,and... DO NOT PUT ANY INFO IN LINE 0....

Not entirely true. There are some UHF frequencies that NOAA uses for linking different stations, but they're in the 410-415MHz range. So yes, something goofy, but NOAA isn't strictly VHF either.

Rudy,

This is all I found in the 400+ Range.

Here are some UHF frequencies that are allocated for use by the
NOAA:

410.1000 - Weather
Link
410.1750
410.4750
410.5500
410.5750 - Weather
Link
410.6750
410.7250
410.8500
410.8750
412.3250
415.8500
415.9000
- Weather Link
416.3750 - Weather Link
416.9750 - Weather Link
 JL
.

It could be a harmonic, or a spur or even a heterodyne. I have 162.4 and 91.5 outside my door on the same tower. I can tune my UV-5R to FM on 70.9 and hear both at the same time. There is another paging type tone on 453.875 that mixes with stuff on the tower and gives me noise on 154.28 over a mile down the road on different radios.

Obviously, there is a setting for the Receive and Transmit. When I look up a repeater, for example, and it says "147.090 PL (100)" do I set BOTH settings to 100.00 or just the transmit.

Amigo, Richard,

Estou com problemas semelhantes, ou seja, com 02 UV-5R, novíssimos, que pararam de transmitir via PTT na lateral do HT.

Não usei cabo nenhum.

Conectando um PTT externo, eles transmitem normalmente.

Já usamos o menu 40 por diversas vezes sem resultado positivo.

Solicito também a ajuda dos amigos que ja aprenderam como fazer para desbloquear o TX do UV-5R, sem uso de cabo e de mais nada. Somente via menus e teclado.

Agradeço-lhes antecipadamente à todos.

Antonio Celso - PU2LZK - LIMEIRA - SP - BRAZIL.

Richard,
I bought my UV-5R in March. It came from the factory with channel 0 programmed. I saved the original configuration for good measure, wiped the channels and programmed channel 0 right off the bat. I have always had channel 0 programmed and never had any issue similar to what you describe.

I say it is more likely something to do with the data in channel 0 and not the fact that it is channel 0. I'd be interested in examining your .dat files. I'll PM you with my email address so you can send them to me.
TIA,
Jim KC9HI

Not sure if this applies...but some computers have USB ports on the front to make easier to plug in devices. I have to use the USB ports on the back or I can't read the radio. The back ports are mounted directly to the mother board versus cables for the front ones.

Just thinking outside the box.

I use the front jacks for programming mine so I wouldn't have expected that. It definitely 'applies' in your case so it is definitely worth knowing. Thanks for sharing your observation.

There can be subtle differences between USB ports on a machine. One of the obvious ones is that you might have a mix of USB generations.

I've no idea if the generation of USB port makes a difference with regards to the UV-5R programming cable. That might be an interesting experiment for someone with the time and equipment.

My front USB ports on the one PC are goofy and I use the back ones, too!

My 2 cents,... I have an older computer still in service, which has version 2.0 USB ports mounted on the motherboard (so at the back of the computer), and additional 1.1 ports that run out to the front. Cases were just beginning to provide front ports at the time I built this computer, so motherboards weren't smart enough yet to provide extra version 2.0 pins to use.
Cent 1: I find that high power draw devices, (like an external hard drive as an extreme example), don't get enough juice from my front 1.1 ports, even with a "two-headed" drive cable that plugs into both ports. I think the wire runners or the mother ports themselves are just not robust enough. The radio programming cable chip draw is minimal, and it works just fine.
Cent 2: I'm sure the 12 Mbs speed of USB version 1.1 is more than sufficient for radio programming at any "serial" baud rate you care to dial up.
Suggestion: For less than a buck on eBay you can get a good USB "extension cord", female on one end and male on the other. Buy a handful--they're handy. Then run one from a good mother-mounted rear port around to the front of your computer for convenience.
Okay that was 3 cents. I'll bring your change tomorrow.Ian

6425. Interesting .DAT File Obsevation

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-18 03:04:53 UTC
From: Jim
Topic: 6425 Message: 6425

I had to overwrite my channel setup in my UV-5R with another .dat file to do some experimenting in an effort to help someone. Some of the channels of the newly uploaded .dat file had no alpha tags where the channel that they replaced did.

Once the new channel setup was uploaded to the HT, I downloaded the new channel setup into CHIRP. To my amazement, the channels that originally had alpha tags when the new channels didn't still had the original alpha tags except the first character was missing.

Apparently the Baofeng software just blanks out the first character of an alpha tag with a hex ff to designate it is blank and then shows it as blank in the spreadsheet. The UV-5R understands this and doesn't display an alpha tag either. However CHIRP downloads and shows the 'garbage' characters. Is this a CHIRP bug or feature?

It's late here so I going to stop messing around for now. I may do some more investigation tomorrow.

Hi, I am new here, to this group anyways. But in my grown up life I am an IBEW Senior Technician.
In my experience com port numbers can change unless you leave that cable plugged in. If it was just a straight USB cable the device would ask for the same number port each time.But these cables ARE a device, most likely a 232 converter. The cable may not have the technology to ask for the same port each time. It does not matter which port you plug a USB device into, they all go to a central buss. It may help if you follow a logical connection order each time you use the cable.

Before connecting the cable, open your frequency editing program.

Then connect your cable. Let your PC recognize and connect to the cable.

Then connect the radio.

Before you close the program, safely eject the cable from your system tray.

If it still won't sync, Just check which port the cable device is on in your pc...then direct the program to look on that port. Welcome to the world of plug and pray.

I have been thinking of jumping into the world of Ham radios...thought I would monitor this group and see if this radio is good. Years ago I had access to a Dak 9 radio telephone Ham radio. It was when I lived in lake Tahoe. Had some great skip calls to other states and countries. not expecting this radio to do that...but its a natural progression from being into scanners and electronics. So far i'm impressed with the radio and the supporting software. I am also very impressed with the knowledge I see here. There seems to be a wealth of expertise from the members on this forum.

Have a great weekend,

Michael D

Hi everybody,

I received my UV-5R from 409 yesterday, charged the battery and when I turned it on it showed the same blank display. Everything else seems to work fine.

I did a full reset (Menu 40) but that didn't help a bit.

Then I kept the battery disconnected last night but this also didn't change a thing.

Any suggestions beside sending the Baofeng back to Hongkong?

73s,
Phil DJ7BJ

Hi Phil,
i disassembled my uv5r recently. When i put it together i made a mistake with the display. The display is connected with two conductive rubber strips to the board. In addition, the display is pressed with a frame made of metal on the board. The rubber need to sit perfectly and the frame need the correct pressure. Otherwise the diplay shows weird characters or remain dark. I had to correct two times the rubber strips when assembling. Perhaps the diplay of your radio does not fit any more due to vibration during transport. I would return the radio if it is still under warranty.

I see how to export as a *.CSV file. If I have a memory file for one radio, the UV-5R for example, what would need to be done to the *.csv file to upload to a different radio... the UV-3R, FT-2800, etc.?

Hi John,
i would give it a 3. It´s not a problem at all if you are able to handle small parts. The repair of the display needs a Torx and Phillips screwdriver. Be patient if it does not immediately work with the repair. Since the battery holder is removed, try the display with the radio turned on and then hold the Battery to the contacts. The success can be seen immediately.
I have an engineering degree and have lots of experience with repairs of this kind. This radio is so inexpensive that a failure is not particularly expensive. I uploaded my photos in the photos folder. Maybe it will help to make a decision whether the radio can be repaired.
When the radio is still under warranty, I would send it back to the dealer. The producer has also a feedback on the quality.

Hi everybody,

I received my UV-5R from 409 yesterday, charged the battery and when I turned it on it showed the same blank display. Everything else seems to work fine.

I did a full reset (Menu 40) but that didn't help a bit.

Then I kept the battery disconnected last night but this also didn't change a thing.

Any suggestions beside sending the Baofeng back to Hongkong?

Paul,
I just learned you can also export to a .chirp file. I'm not sure which would be better for this purpose. They may both work equally well.

I believe that first you would export from the 1st radio to a .csv or .chirp file. Then on the 2nd radio you would "Download from radio to create a CHIRP template if you don't already have one. I'd save it as a CHIRP .img file just in case. Then you would import the .csv or .chirp file from the 1st radio into CHIRP. When you do this you will get a chance to unselect any channels that you don't want to import and also have an opportunity to change the channel number that each one is ultimately imported into.

I hope this helps,
Jim KC9HI

To see if you need to clean out the internal mic hole, in a darkened room press a key such as the EXIT key and with a manifying loop or glass (if poor eyesight) view the hole from different angles.

If you can see light from a 20-30 degree angle you will know that the hole is clear. Looking at it head on it will be black as the mic element is very close to the hole. It looks pretty much like a lunar eclipse.

This is not to say that you wouldn't benefit from reaming out the hole a bit as has been suggested in the past. I have confirmed that you almost need your nose on the radio for good audio out as it seems this unit was made for noisy environments.

John

Perhaps the reason for this has to do with expansion and contraction of disimilar materials. Doing what you did sort of proved a contact issue that may be an issue with a cold solder joint (97% of the time) but I have seen many times the condition that Juergen has discussed.

Quite often this problem is the result of leaving a phone/radio/calculator in the car where the sun brings temps up. These temps distort the cases and holders so that electrical contact is no longer possible as designed. In your case perhaps it just wasn't assembled correctly and the temp difference caused it to work for a while.

Fun anyway....

Thanks, Jim, I'll give that a try.

I just programmed two radios for a friend, a UV-3R and a UV-5R. I set up both the same, same frequencies in the same channels. I was just looking for an easier, faster way, especially with CHIRP's ability to program other popular radios.

John, Now this is a really good idea! I just tried it and it actually works.

What I did was gently push a metal paperclip into the mic hole of my UV-5R to make sure there was no flash covering the hole on the inside of the case.

But this definitely should be the first step in the process of determining if a paperclip or any other 'tool' should be used on the mic hole.

(((((WARNING)))))

For the benefit of those new to this sort of thing. The cylindrical mic element is close to the opening in the plastic. It is best to remove the cover completely to ream the mic hole. If you don't feel comfortable taking the unit apart use extreme caution. Do not use power tools, a miniature drill bit between the fingers and some gentle pressure should do the trick. Metioned in the thread a paperclip will work, Don't exert too much force, when the paperclip breaks through you can damage the element.

Sometimes us old guys forget the minor details. I am sure a few of us in here (myself included) have made this mistake.

Have modified two units successfully by using a small drill bit. Limit the drill depth by wrapping several turns of electrical tape around the bit, leaving 3/32nd of an inch of the bit tip exposed. Rotate the bit between your fingers carefully until the hole clears. It helps to rotate the bit several times then remove the bit and blow out the removed plastic, repeating the process until you have a clean hole the diameter of the bit.

In my experience blowing into a hole that is a port our jack of sorts is a bad idea...use a vacuume instead, and partially eclipse the hole to create a swirl of negative air flow over the hole. The black type stop guide is a great tip...used that one many times.

For those of you that have more than 1 UV-5R that you want to setup the same, I would recommend using the export/import method instead of direct Download from the 1st radio and a direct Upload to the 2nd. I'll explain why...

CHIRP basically pulls everything off the radio. Even though it doesn't necessarily give you access to what it has in it's UI, it has everything. So when it CHIRP it back, it puts it all back. That's fine when you are only working with 1 radio. Not so much if you are working on multiple UV-5Rs.

For example, the power on message. You probably want to keep the power-on message the unchanged on the 2nd radio. Unless you go in and edit it in CHIRP to match the radio that you are about to upload to, it will be changed to the power-on message of the 1st radio. Just remember to do the edit before uploading because the power-on message can't be changed from the radio.

Another example is the [6] key + power-on message. If your 1st radio displays "1203151 VER05" when the power is turned on with the [6] key pressed and the 2nd radio displays "1204171 VER05", the 2nd radio will acquire the same message as the 1st radio once you are done uploading the image retrieved from the 1st radio.

The Baofeng software, on the other hand, skips over both of these areas when reading and writing channels from and to the UV-5R. The VIP software, which allows you to edit the power-on message, requires a completely separate read and write process to change it.

So if you've got a CHIRP .img file from a radio that you want to use in multiple UV-5Rs, load it into CHIRP and then export it to a .chirp file. Hook up the 2nd radio and Download from it to acquire it's template. Import the .chip file into that template and then upload to the 2nd radio. The power-on message and the [6] key + power-on message should not be affected.

If this seems too complicated, then just use the Baofeng software. Read from the 1st radio, switch radios, write to the 2nd radio, switch radios, write to the 3rd radio and so on.

already have one. I'd save it as a CHIRP .img file just in case. Then you would import the .csv or .chirp file from the 1st radio into CHIRP. When you do this you will get a chance to unselect any channels that you don't want to import and also have an opportunity to change the channel number that each one is ultimately imported into.

6460. Tri-band HT Hack on UV-5R?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

I saw an article in 2600 by lOcke in of the most recent issues that discusses a hack to convert a Beofeng UV-3R Mark II into a tri-band HT. Here's a reprint: http://servv89pn0aj.sn.sourcedns.com/~gbpprorg/2600/2600_29-2_Page_26.txt. I was wondering if anyone else saw it, or if they were able to figure out how to do the same on the UV-5R? I couldn't figure out how to modify the .INI file of the CHIRP software (couldn't find any .INI files). The only configuration files I could find were all gibberish. I'm guessing the CHIRP software has changed from version 1.10.

The Baofeng software uses a .dat file for data storage.
The CHIRP software uses a .img file for data storage.

When you say tri-band you are probably referring to adding 220 MHz capability. This the UV-5R will not do.

I am happy with the frequency range afforded me by CHIRP so I have not had any reason to try the following. I'm not suggesting that anyone do this so if you do, you do so at your own risk.

The "UV-5R File Modification.pdf" guide in the files area will supposedly teach you how to hack the .dat file to enter just about any frequency that you would care to program into the UV-5R. Just don't expect every frequency to work. Did I mention, do this at your own risk?

I did not read the article, but I have followed this on the UV-3R group.
In reality it was an experiment, but yielded no useable results.

The UV-3R (and probably the UV-5R), can be "hacked" into transmitting
and receiving anywhere from 136mHz to 512mHz. The reason NOT to do it is
that the radio only contains input and output filtering for the
published ranges.

Without the proper filtering the radio can not receive any useful
signals, and if you transmit nothing comes out. Transmitting into a
filter which suppresses that frequency will most likely damage the final
amplifier permanently.

That's why it works to hack the "band edges", but the farther you get
out of band the less it works.

It may have actually worked with the very early UV-3R radios, which did
not have enough filtering, or it may not have. It certainly does not
work with the current production ones.

VeroTelecom who makes the UV-3R announced a new model, I think they
called it the UV-X5, which has some different cosmetics (different shape
and LCD), but still has the two band display. It also has the Thai CB
band (245mHz?) and you can display 2 of the 3 bands at any time.

It may be "hackable" to the US 222 mHz band, or the Philippine 220 mHz
LMR band, or not. None have ever been "seen in the wild", so no one can
tell.

Note that one of the models of the Wuxoun has 220 mHz. It has it instead
of UHF, as a friend of mine found out, much to his dismay.

narrow. May not make a difference. It depends upon the final amplifier performance. Probably not a factor.

> Original antenna or Nagoya telescopic antenna??

A longer, more resonant antenna will give you more gain, which will mean that your signals will travel a little farther, but more importantly your ability to receive will be better.

There is a point of diminishing returns, where the receiver overloads or is interfered with by signals that are nearby in frequency (intermod), or transmitters that are close by (desensitization).

A telescoping antenna that is not set properly will produce poorer results, and in extreme cases, damage your radio.

> UHF or VHF?

Straight line of sight with nothing in the way, VHF.

That's just basic radio theory. Since it's theory, it does differ from practice.

Very true. Both my 5R and Yaesu HT can easily hit the 70cm repeater on a local mountain, but neither can key up the 2M on the same mountain/same tower.

I purchased the UV-5R from radioshop888.com on August 6th, 2012. I received the radio today, August 18th, 2012 (I'm in western Texas, USA).

BFB251 / 120722A VER-05

Power on-3 and Power on-6 respectively, of course.

Non-accented female English voice. Black radio. Only option when purchased was the USB cable. Using the sub-$4 antenna (works excellent. Great reports on 2m and 70cm).

IMHO, I believe the difference is the antenna.
If your antenna is a wire approx 4 ft long that works out to approx 9 db gain.
Even if you raise your HT up in the air, it's the length of the antenna in air that counts.

What about antenna? An antenna that works well for 2m may very well work also for 440, like using a 40 m halfwave dipole as a 3/2 wavelength for 15 m, but is very high impedance at 20 meters.

But for 220 mhz you would need an antenna designed to work all three bands.

Besides, does anyone actually use 220? ;-)

Glad to help.
And don't under estimate the scanner's receiver.
It sounds like it's holding it's own.

Enjoy the weekend.

Paul,
Yes we use 222 daily along with 144 and 440 MHz!
:-)
Try it some time!

What about antenna? An antenna that works well for 2m may very well work also for 440, like using a 40 m halfwave dipole as a 3/2 wavelength for 15 m, but is very high impedance at 20 meters.

But for 220 mhz you would need an antenna designed to work all three bands.

Besides, does anyone actually use 220? ;-)

A yagi beam if you really want gain, or log periodic.
Ask 100 hams about the best antenna and you'll get 120 answers, there is no substitute for trying your own antenna and deciding for yourself.

Don't be too quick to discard the Baofeng provided antenna. It performs very well for its size.

Julian is correct. I have the Nagoya NA-701 and the $3.79 antenna that had been discussed here in the group. They all 3 have similar performance. I like the compactness of the Baofeng antenna, but when the UV-5R is clipped to my belt or pants pocket, I prefer the thin and flexible aftermarket antennas compared to the nearly inflexible Baofeng 'spike'. I've been using the $3.79 antenna since receiving it at the end of June.

Hi Russ,
Yep. I've been using CHIRP to program 7-character alpha tags ever since it was capable. Unfortunately that is also why I didn't bother to save the web page mentioned in the brick-o-lore blog. I'm looking for it now to do some research into how the data is stored in the Baofeng UV-5R .dat file.

Hi..

We need a little more information first, because what you describe as being 120 miles away is extremely unlikely. UHF frequencies are LOS... line of sight and for the radio to pick up and LOS signal at that distance is unlikely.

If we work backward from the LOS formulas, either the transmitting antenna or receiving antenna would need a height of about 10,000ft to get a distance of 120miles. Then to have a 100% quieting at that distance would mean a very high transmitted power, thousands of watts.

Can you identify the transmitter, its location, and your receivers location? Most likely the transmission is being relayed over a nearby system.

AAA batteries only have 1/3 the capacity of an AA. The units using
AA batteries are larger, but last longer between charges.

the uniden was designed as a receiver only, the uv5r is software defined AFAIK and its circuits are compromised by having to do more functions, 2 bands +? on tx/rx, and made as cheap as possible, even today, a uniden bearcat of that age will still get more on ebay than the uv5r, its basic physics, you can't make everything smaller and expect the same results or may yaesu 847 would fit in a cigarette packet by now.
That is why you can STILL buy dedicated receivers, they work better than most tx/rx combined units.

6498. Bigger battery is better

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-19 20:38:35 UTC
From: stanwhite_snr
Topic: 6498 Message: 6498

Hi,

So the bigger battery (3600mA/Hr) is the better battery. For one obvious reason, and one very obscure reason.....

Today, I discovered the display darkened as a result of the heat when I had a long QSO on the standard battery. But it does not happen on the bigger battery, which seems to absorb a little heat from the chassis and allow the display to work OK. (At least for the QSO durations I am used to...)

The effect of the heat on the battery is unknown, but the radio didn't self destruct! :-)

YMMV,

Regards and 73,

Stan, G4EGH

If you would peruse Msg# 5337 there might be a clue as to why you would not do this.

I was faced with the same issue, I purchased a battery eliminator for $12.95, really a quick change over, hook up the mag antenna in some part of a second with a BNC thingy and down the road I go.

If you review the info from Battery University on LION batteries you will gain great insight on how to manage portable power.

Topic: 6507 Message: 6507

Well I was curious , I just had to know:
I connected a 4.5 foot micky mouse wire antenna to the Uv5r, Squelch full open. It picks up no readable signals on 446.000 simplex
The old 26 year old uniden scanner, picks up clearly readable voice activity on 446.000 but not full quieting.
Clearly side by side the old scanner has much better sensitivity.
Unbelievable

It should not be unbelievable as the scanner is a better quality radio and cost more. These HT's are cheap, both in cost and in build. They are not that great, but for the price!! I have one and I think it does okay for what I am usning it for.

If I had an adapter, I would check the sensitivity of the Baofeng receiver on VHF and UHF. Maybe in a few weeks when I get an adapter.

Blessings,
KS5B

The TYT charger base will operate fine from the car accessory plug. The Baofeng charger would too but it shuts of at a little over 13 volts. Easy to cure. Just drop the voltage with a diode or two or find a power cord with a 12v regulated output. Then all you would need then is a 2nd battery. Talk using one while the other is charging.

Thank you for that report.

While I am not surprised at the results, the distance of the signal has me puzzled.

I opened my HT as the internal mic did not function after I programed the radio. I think it is the connector inside the radio. The external spk/mic works okay.

I have some pixs I can upload if anyone would like to see the radio inside. I did fix the connector, but you have to take the display off. No problem, if you do not use oily fingers to handle the parts. I used my oily fingers instead of using white gloves, and now some of the display is smeared, does not work as it should. But the internal mic works just fine.

Fortunately, I did not pay $325 for the radio like I did my W32 Icom when I first bought it.

Stan,

I do not believe that it is the cost between the units as much as the design function of each of them. The scanner is a very good receiver and its sole purpose in life is to do just that.

The UV-5R is designed to transmit and receive at about the same distance..... 4 watts through a stubby antenna only goes so far and that's about how far it can receive. Since there is no point in the transceiver to receive farther than it can transmit there is no real incentive for it to do so.

Do not feel tramped on here as we all try to squeeze more out of equipment than it was designed to produce. We change power, antennas, mics, quick mods, tweak and whatever. Sometimes the transmit is improved, sometimes the reception gains.... make one better then you need to make the other better, eventually you can improve no more.

The real proof here would be to send Frank a Motorola, Icom, Yaseu or whatever and see what happens. I would suspect that a $300 radio with the same 4 watt output would have about the same results and if one of the units could hear it then it should/would have the power to get back to it also. Can you imagine walking around with a little 4 watt HT that can receive a signal from 120 miles and yet can only reach out 35 miles without a Yagi base antenna? Not my idea of a good design.

I am more interested in the signal that Frank is getting from 120 miles on 2 meters. I am beginning to think that it's NVIS from the transmitter, whether it is intentioned to be so or not as that is about the intended range of NVIS. That is quite a distance to cover for sure.

Very interesting for sure and worth working to the end.

I am not sure that the signal Frank is receiving is 120 miles away. It is possible if everything is optimal, but it would have to be on a mountain top at least 1100 feet higher that his location to just clear the ground in earth bending, or grazing angle. The 4.5 foot antenna has some gain compared to the stubby duck. So it would be interesting to hear more. I usually like to have absolute measurements, as that is a better comparison.

I don't have an adapter or I would measure the RX sensitivity at the radio input and see how well it can hear a 1kHz tone with the deviation set to 3kHz.

I hope to order an adapter for both female and male SMA connectors so I can make those measurements.

Will let you know what I find out. May take awhile to get the adapters and make the measurements.

I just did a quick check and the UV5R has a birdie on receive on that frequency. This means the squelch does not open until the level reaches about −116dBm (squelch at 1) with 3KHz deviation. On 446.1MHz the squelch opens at about −127dBm with the squelch set to 1 and −120dBm with the squelch at 9.
Like most receivers (including so called good scanners) there will be some birdies in the receiver. It’s just unfortunate when the birdie appears on a wanted frequency.
I used a Marconi 2030 generator for the tests.

Grant, ZL2BK.

I just checked what is available for dual band hand helds, and for $165 CDN, you can have a Yaesu FT60, and it has the Air band as well. So, at 3 times the price you do get Yaesu quality and the ability to simply return it to your favourite ham store.

Just another option if you don't like your $50 radio.

*2 Meter / 70 cm, 5 watt CTCSS Wide Receiver

I've owned an ft60 and it still would not compare to a dedicated receiver such as the bearcat, (i owned a bearcat over 20 years ago).

I just checked what is available for dual band hand helds, and for $165 CDN, you can have a Yaesu FT60, and it has the Air band as well. So, at 3 times the price you do get Yaesu quality and the ability to simply return it to your favourite ham store.

Just another option if you don't like your $50 radio.

2 Meter / 70 cm, 5 watt CTCSS Wide Receiver

Frequency Coverage:
Receive:
108-137 MHz (Air Band)
137-520 MHz (AM / FM)
(Cellular phone Blocked)
700-999 MHz (FM)
(Cellular phone Blocked)
Transmit:
144-148 MHz
430-450 MHz
Transmit Output Power:
High 5 W (@ 7.2 V FNB-83)
Mid 2 W (@ 7.2 V FNB-83)
Low 0.5 W (@ 7.2 V FNB-83)
Modes of Operation:
F2 (data packet 1200 baud), FM

On Mon, Aug 20, 2012 at 12:47 AM, The Simpsons <grant@...> wrote:

I just did a quick check and the UV5R has a birdie on receive on that frequency. This means the squelch does not open until the level reaches about −116dBm (squelch at 1) with 3KHz deviation. On 446.1MHz the squelch opens at about −127dBm with the squelch set to 1 and −120dBm with the squelch at 9.
Like most receivers (including so called good scanners) there will be some birdies in the receiver. It’s just unfortunate when the birdie appears on a wanted frequency.
I used a Marconi 2030 generator for the tests.

Grant, ZL2BK.

Subject: Re: [baofeng_uv5r] another uv5r to old uniden scanner comparison

I am not sure that the signal Frank is receiving is 120 miles away. It is possible if everything is optimal, but it would have to be on a mountain top at least 1100 feet higher that his location to just clear the ground in earth bending, or grazing angle. The 4.5 foot antenna has some gain compared to the stubby duck. So it would be interesting to hear more. I usually like to have absolute measurements, as that is a better comparison.

I don't have an adapter or I would measure the RX sensitivity at the radio input and see how well it can hear a 1kHz tone with the deviation set to 3kHz.

I hope to order an adapter for both female and male SMA connectors so I can make those measurements.

Will let you know what I find out. May take awhile to get the adapters and make the measurements.

Stan

On Sun, Aug 19, 2012 at 9:46 PM, John Leahy <jleahy00@...> wrote:

Stan,

I do not believe that it is the cost between the units as much as the design function of each of them. The scanner is a very good receiver and its sole purpose in life is to do just that.

The UV-5R is designed to transmit and receive at about the same distance..... 4 watts through a stubby antenna only goes so far and that's about how far it can receive. Since there is no point in the transceiver to receive farther than it can transmit there is no real incentive for it to do so.

Do not feel tramped on here as we all try to squeeze more out of equipment than it was designed to produce. We change power, antennas, mics, quick mods, tweak and whatever. Sometimes the transmit is improved, sometimes the reception gains.... make one better then you need to make the other better, eventually you can improve no more.

The real proof here would be to send Frank a Motorola, Icom, Yaseu or whatever and see what happens. I would suspect that a $300 radio with the same 4 watt output would have about the same results and if one of the units could hear it then it should/would have the power to get back to it also. Can you imagine walking around with a little 4 watt HT that can receive a signal from 120 miles and yet can only reach out 35 miles without a Yagi base antenna? Not my idea of a good design.

I am more interested in the signal that Frank is getting from 120 miles on 2 meters. I am beginning to think that it's NVIS from the transmitter, whether it is intentioned to be so or not as that is about the intended range of NVIS. That is quite a distance to cover for sure.

Very interesting for sure and worth working to the end.

JL

It should not be unbelievable as the scanner is a better quality radio and cost more. These HT's are cheap, both in cost and in build. They are not that great, but for the price!! I have one and I think it does okay for what I am usning it for.

If I had an adapter, I would check the sensitivity of the Baofeng receiver on VHF and UHF. Maybe in a few weeks when I get an adapter.

Hi Mike

The simple answer is that height is your friend, but you might find it just isn't possible to do it reliably.

Things you have to consider are, are you inside or outside, if inside, what are the walls made of as each wall adds attenuation. Drywall will reduce your signal more than wood or glass. Aluminum siding, is worse. Then, you will also have to consider the noise floor at the repeater and at your location.

If this is why sitting at your desk all day, consider mounting an outside antenna on the roof and connecting it to the handheld..

Then, you have to consider other options, like what is between you and the antennas at the repeater.

To be blunt, assuming the stock antenna works well, anything better will make an improvement, but no more than about 3-4 db. About 1/2 an S unit. You might get to 6 db and that would be about 1 full S-Unit. Again, height is your friend.

To see if you have a coverage path, have a look at Radio Mobile http://www.g3tvu.co.uk/Radio_Mobile.htm and do a coverage path for that repeater.

I thought a little more long antenna may be better.
But i was wrong.The opinions are negative about the nagoya's, however the nagoya antennas are more long than original baofeng antenna.
I use 2 baofeng for personal communications on talk-about motorola frequencies.(465Mhz)

Just to say I've got the same problems, Tried Win7 64 bit, Win32 bit, XP, At best I get to the Com dialog but then only offered Com 1 or 2. Radio Tx red LED comes on steady for a few seconds, flashes nine times, display LED comes on.

Then the CHIRP error windows shows "Radio did not respond" after 'Download from Radio' Connector checked, earphone/mic works OK.

The only thing I can think of now is what used to work, now doesn't. Radio only a couple of weeks old, new cable. Maybe something changed?

Someone cleverer than me will have to sort this out.

I modified my UV-5R by enlarging the mic hole to 1/8” and this didn’t help the transmit audio enough to be worth the trouble.

Just get up close to the hole (within 1”) to talk and you will be ok. Also make sure that menu #5 is set to WIDE.

Subject: Re: [baofeng_uv5r] Re: Mic hole issue

Have modified two units successfully by using a small drill bit. Limit the drill depth by wrapping several turns of electrical tape around the bit, leaving 3/32nd of an inch of the bit tip exposed. Rotate the bit between your fingers carefully until the hole clears. It helps to rotate the bit several times then remove the bit and blow out the removed plastic, repeating the process until you have a clean hole the diameter of the bit.

(((((WARNING)))))

For the benefit of those new to this sort of thing. The cylindrical mic element is close to the opening in the plastic. It is best to remove the cover completely to ream the mic hole. If you don't feel comfortable taking the unit apart use extreme caution. Do not use power tools, a miniature drill bit between the fingers and some gentle pressure should do the trick. Metioned in the thread a paperclip will work, Don't exert too much force, when the paperclip breaks through you can damage the element.

Sometimes us old guys forget the minor details. I am sure a few of us in here (myself included) have made this mistake.

Andy

> Transmit on narrow or wide mode??

narrow. May not make a difference. It depends upon the final amplifier

performance. Probably not a factor.

I would have to respectively disagree.

Menu #5 needs to always be set to WIDE (5 KHz deviation) UNLESS you know for sure a repeater you are using is setup for Narrow (2.5 KHz deviation)

We have had several local hams set their UV-5R to Narrow (2.5 KHz deviation) when they first got them and we could barely hear them through the repeater.

I know there has already been MUCH discussion here on this subject but try it for yourself and see if you don’t get better audio reports when using WIDE (5 KHz deviation)

Setting for menu #5.

I would add that, if you haven't already bought the Nagoya telescopic antenna, don't. It is known for dismal performance.

> Original antenna or Nagoya telescopic antenna??

A longer, more resonant antenna will give you more gain, which will mean that your signals will travel a little farther, but more importantly your ability to receive will be better.

There is a point of diminishing returns, where the receiver overloads or is interfered with by signals that are nearby in frequency (intermod), or transmitters that are close by (desensitization).

A telescoping antenna that is not set properly will produce poorer results, and in extreme cases, damage your radio.

> UHF or VHF?

Straight line of sight with nothing in the way, VHF.

That's just basic radio theory. Since it's theory, it does differ from practice.

Geoff.

OK, Narrow (2.5KHz deviation) will work fine IF both stations are setup for it.
Whatever setting, both stations need to be the same.
And I thought after my post that the person was asking about "range" and really wide or narrow would not make any difference in range
As long as both or however many stations are involved are setup for the same deviation.

Mike,

I think the only way you will get that kind of range is with an elevated outdoor antenna. It doesn't have to be fancy, just up above the average terrain. I have a discone (which theoretically shouldn't work terribly well on transmit due to no real gain at all) at 10 meters up or around 30 feet. It is fed with RG-8X. I easily can work repeaters 20 miles away on both 2 meters and 440 MHz with full quieting. Your mileage may vary.

73,

Chas

tropo, sporadic "e" all very unpredictable, but do increase range massively, here in UK we can get into Holland France and Belgium when things are good, and on 10 metre fm, we can get NY state repeater (3000 miles?) on the bigger radios, yaesu etc, of course, the solar cycle is more responsible for the 10 metre "lift" Pity its not something you can rely on.

Hi all

I also dissected my uv5r to do the audio mod,

I found that when I removed the display the tracking was shiny in places and not in others, It looked like flux residue left after a flux bath.
Upon assembly I used some IPA (Isopropyl alcohol) to clean the boards display pads and screen to remove my fingerprints.

After reassembling the unit I found the display to be better than it was, as the bottom line of the display tended to fade out when it had been used for a bit and got warm.

Radio sorted, and for the price a great bit of kit.

Hope this is of help..

Cheers
Dave...

Technically it's a wrench. It's also known as a nut driver.

The 409 shop calls it a "T01 X key for Radio repair tool".

<http://www.409shop.com/409shop_product.php?id=102148>

It's listed under radio repair parts, not under tools, so it's hard to find.

I bought a T01 from them, but looking at it now, I probably should have
bought the T01/T02 combo deal.

Geoff.

20 miles with an HT is not impossible. But there are so many factors involved it is hard to give a definitive solution. The path of least resistance is to get a better antenna, and put it as high as you can. I have made acopper cactus antenna <https://www.google.com/search?q=copper+cactus> for my HT. This improved my range considerably. A ladder wire j-pole, as previously discussed on this list, works amazingly well too.

If you are looking to constantly hit that repeater at 20 miles walking around with your HT and not tethered to some external antenna, good luck with that. It is doable. But is it going to be a reproducible, quality experience? Probably not, regardless of what you screw to the top of the radio. I have used some "high quality" HT antennas, (Diamond, etc) and they still don't perform nearly as well as when the HT is attached to a simple ladder wire J-Pole a few feet up a tree.

I just remembered i also use a watch back removing tool, but its not ideal as the pins on the tool are too short to go over the shaft of the volume control, but with a bit of fiddling i could get the nut to turn using two of the three pins at an angle to get at the nut.

Deviation is one thing. ERP is another. (Effective Radiated Power).

Your problem is ERP.

Try another antenna, or the antenna for the UV3R and see if it is better.

Other than that, you'll need some sort of test equipment to see your RF
power out. If you get to something like an IFR, you can test your
deviation (which is your audio).

I think that we need a little more info to go on like the distance you are working, inside or outside a building or vehicle and the antenna you may be using. Any other pertinent data may help also like frequency and terain.

I'd be interested to know if anyone has had any success with this.
I've just bought a UV-5R and I'm currently struggling to hit the local repeaters from home.
I think I actually had slightly better results with the UV-3R.

I've had a couple of occasions where I can key up a repeater ok, but my audio isn't actually getting though. For example, I'll hear the pips confirming access but I can't hear myself when listening in on another radio. I thought this might explain why the CTCSS is getting through, but not the audio from the mic.
I've checked that I'm set to wide and that the mic hole isn't blocked (and that the CTCSS tone is correct etc).

I'm waiting for some adapters to arrive so I can try different antennas.

tried external mic? i found even the cheap earpiece i got with my uv5r was better than without. If your ctcss is keying the repeater chances are you are working ok, just lacking audio not rf power.

Two thoughts, now that you bring them up.

The first is where is the "other radio"? If it's close enough to hear it, it will not be able to hear the repeater because your radio is overloading the front end. (desensitization).

Two, it's a Chinese LMR (land mobile) radio, NOT a Japanese mobile. It's designed for you to talk closely and loudly, to reduce the effect of a noisy environment.

Japanese drivers are NOT allowed to talk into a microphone while driving. So they skirt the law by laying the mic in their lap and talking in a normal voice over it looking forward, not down. That's why their radios are so "hot".

Geoff.

Yeah, that was my thinking.
I do have some audio. It just seems as though it might be low. I'll do a bit more testing with the included headset.

FYI I'm in North London trying to work 3 or 4 within a 5-7 mile radius. Mainly on 70cm. I've not had much luck at all on 2m.
Interestingly I can get into GB3LV on 70cm if I stand in the right place, but I can't get into GB3NL on 2m which I believe is on the same site.

Thanks very much for your advice chaps!

☐Direct frequency access. See:
http://hamgear.wordpress.com/2012/04/04/review-baofeng-uv-5r-part-i/
☐There are 9 settings for the squelch threshold, but changing it
doesn't make a difference. Whatever the setting, the Baofeng wakes
up at -129dBm on VHF, and -126dBm on UHF. Under normal conditions the
default squelch threshold seems to be just right, but in a noisy
environment this bug might haunt you.
☐The same is true for the VOX sensitivity. It doesn't matter
what setting you choose, the sensitivity stays the same.
☐Receiver is NOT off frequency

SainStore/Nicheone

Could not get the USB drivers to work that are posted for Win7/32 bit in
the files section. They loaded without the ! and yellow triangle, but
the software would not talk to the radio. I then tried the drivers
supplied with the USB cable--which I believe were version 2.0, and they
worked. Installed fine on XP, audio a bit low but better on external

earpiece. Query function of adjustable pot under CE sticker in battery compartment.

Since the battery is 7.4V it seems it has 2 cells of 3.7V connected in series. So, the type may be LiCoO2 (3.7V 140 mA.h/g)

And I can hit the 147.330 repeater in Chico from Morgan hill when the atmospherics are ducting the signal through the valley with the ducky on my FT-60. And there are also days i cant even hit crystal peak reliably. We have no idea what the guys local topology looks like, the elevation of the repeater is, line of site, etc. So the original suggestion stands. Get a good antenna up as high as can.

Kind regards,

Ray

All

There are many variables, none of which are directly related to the handheld.

If you need it to work do the following:

- Make sure you have the right frequency, ctcss, tone burst, etc.
- Get as high as you can
- Hold the radio away from your body (if you can) and ensure it is vertical
- Don't have it on your belt and a speaker mic. If you do, your range is 1/10th of it having it away from your body
- Use an external antenna
- Stand on your roof
- Don't try to listen to yourself on another handheld unless you are 100m away from it. :)

5 watts is 5 watts is 5 watts. It has nothing to do with your deviation (wide or narrow), the CTCSS tone, etc.

Your $50 radio is working as designed.

Mike va3mw

Now, if you were using CW or SSB, your range will improve due to the SNR (signal to noise radio) improving. They are also much more RF efficient and your bandwidth is less.

Range? Build a 3 element beam using whatever you have at hand. I once whipped up a killer beam one super hot summer afternoon and I wasn't going out and used coat hangers and a 1x2 to make this:
http://www.arrl.org/files/file/Technology/tis/info/pdf/9304054.pdf
At 15 feet above ground, in the open, 20 miles is easy.

I think we all have done that.

In fact, you can use a cut up tape measure for the elements and travel with it.

With 2 of them, you can handheld point it at a OSCAR satellite and talk more than 20 miles. Even on FM.

http://www.amsat.org/amsat-new/echo/EchoHT.php

Welcome to Echo. I have done it from the middle of the woods on a canoe trip. How cool is that!

You don't need to make the additional trip through the CSV or .chirp
file. Just save the first .img and import it directly to the second.

Also note that you can download from one, download from the other, then
use copy/paste on some or all of the channels.

IMHO, any time I have two identical radios, they're usually programmed
identically as well (same power-on message, for example).

Tony is correct.

2.5 KHz vs. 5.0 KHz
Either is correct depending on it's use.
Here's a link that may help clarify.
http://ba-marc.org/writeups/gmrs-frs-freq.htm

Most Ham & Commercial requires 5.0 KHz deviation (wide).
Some FRS operation requires 2.5 KHz (narrow).

Use this as a starting point.

HELP please I recently bought a baofeng UV 5r. Friend has one. It is a disaster to figure out how to load frequencies .. but my friend spent two hours with me. From his and his PC program we loaded most of our local repeaters.

However . We have the driver and software loaded on my laptop and in the very end . We ended up with a connection error .

"Run Time Error 8020"

I've spent time this evening doing the same on my desktop and Vista (Win 7 on my laptop) . And have gotten to the same spot. It must be something easy . Please advise .. thanks.

Amigos,

Eu estou usando a Nagoya 733, com excelentes resultados no Baofeng UV-5R.

Em seguida pretendo experimentar a Nagoya 666.

Quero ver qual das duas apresenta melhor resultado.

Um abraço a todos.

From: Alek Kristola
Topic: 6567 Message: 6567

Got on the air with a local ham.
No dice, but I think it will work.

I have a few error messages in the computer program, I can't get RTTY mode to work. What I need to do is buy some decent wires, the cheap eBay deal on wire isn't working. Plus, in order to transmit I have to pull out the wire slightly to get it to work, even using the two name brand cables I have.

I was transmitting from the UV-5R through a 30w amp and out my mobile antenna. The other ham reports a definite signal received but his program (which I know works, as he does a lot of digital mode on 2 and 6m) wasn't translating it right, plus the signal dropped in and out. I suspect the signal problem is related to my setup. The Easy Digi is the VOX model. I'm not sure if the UV-5R is starting to drop out of VOX between words and causing problems. Also my amp has an irritating relay delay that is more than likely compounding any other transmitting issues.

On receive, I could tell on my computer when he was transmitting, but nothing legible popped out. Even with possible transmitting issues, the receive end shouldn't act as funny. This leads me to think it's a cable problem, a software problem, or possibly an Easy Digi problem.

I'm going to start from the software end and work from there.

Oh, a word of caution. Using one UV-5R to transmit packet using 30w less than 10 feet from another UV-5R trying to communicate with the local repeater does not work. I almost thought for a minute that I fried something. Turn off other radio, then transmit. A pain, but oh well

Will update as I know more.

And my seperate issue with my UV-5R PTT button solder QC fail is on hold. I ended up panicking and putting the radio back together to make sure I didn't fry something. I also lost the speaker during all this, which had I read the online instructions I would have unsoldered anyway. Radio still works using a speaker mic, but I lost function on the green RX led somewhere along the way. I will open it up this weekend and put the speaker back. Detailed photos will happen, I promise. A writeup will accompany this. I might take video also, but the quality isn't great compare to my DSLR.

I just did exactly this, editing the power up message before loading into the new radio.
Then set Menus 7, 35, 36, 37, 39 to off, and Menu 38 to msg. Done!

Thanks,
Paul - AE5JU

Dan,
If it is not a problem to have the [6 key + power-on] message (which we've never figured out for sure what it means) overwritten by one from another radio, then I agree with you. However, if the goal is to leave the [6 key power-om message] as-is, then the extra steps are mandatory.

Is that something you could 'fix' if someone turned a bug report in?

Thanks to me (and mostly a buddy who wishes to remain anonymous)have modified the UV-5R programming software and we can now enable the entry of any frequency we want into our key pads from 100-999mhz

Just check out:
http://groups.yahoo.com/group/baofeng_uv5r/files/UV-5R%20Freqency%20Unlocker/

Have fun with it, its at your own risk but I've not seen any problems with it, and making changes via Chirp does not affect or disable this little hack.

Be sure to read the list of tested and working TX frequencies.

Hi,
I can vouch for an external speaker/mic.. another local & I tested out a Kenwood S/M on his UV-5R, the difference in audio was 10 fold!
Punchy, solid speech whereas the internal mic, even close talked, was poor.

Ive done the *bigger mic* hole on my 5R and its does make a slight difference, but an extenal S/M is the answer . . Im just waiting mine to come from over the water!

I am not trying to rain on your Parade, my respects for all the effort that you people put into this project. The frequencies listed are from 140 to 520 but somehow skip the 220 band. That's like ordering a Big Mac from McDonald's and getting no meat. In short, why would anyone want a mac with no meat and why all those frequencies but no 220 band. What a waste!

Hey, thanks for your advice.
Most of those points are things that I have been doing.
When I say testing with another radio, I did try with one on the other side of the room (which probably desensitized as mentioned). I did however also try listening in to the repeater via echolink on my phone which would not have had that issue.

I understand that it's a cheap 5watt radio, so I'm not expecting miracles. I'm just surprised that the tx performance seems to be slightly worse than the 2watt UV-3R.

Subject: [baofeng_uv5r] Re: Baofeng UV-5R Field Programming Unlocked!

I am not trying to rain on your Parade, my respects for all the effort that you people put into this project. The frequencies listed are from 140 to 520 but somehow skip the 220 band. That's like ordering a Big Mac from McDonald's and getting no meat. In short, why would anyone want a mac with no meat and why all those frequencies but no 220 band. What a waste!

Snap ! my NA - 771 works a treat too !

Out performs the original antenna and doesn’t overheat the radio on TX as quickly either…

Cheers,

Rob.

P.S. anyone heard how the drivers for the USB programming lead go under Windows 8 ?

I have made this modification. Really not worth the effort. Only minimal improvement and is not worth the effort opening up the radio. I found the hardest part was to get the LCD working again without loss of pixels. BTW, these are "small" smt parts.

This will not help hitting repeaters, only a very slight increase in TX audio. My advice is... don't bother.

Farther down on the page "These mods likely don?t ?boost? overall audio level ? they do change the tonality and frequency filtering characteristic. Anyway, the result is still more pleasing to the ear."

Since he did not post any description or measurements of the changes, I can only assume that they worked for his voice and his taste.

One can only guess what he meant by more pleasing to the ear in terms of voices, I know that my voice would be made LESS intelligible by any mods which add high frequency response (I have a deep voice), and for example a woman with a higher voice would find the opposite.

In the end though, they may do nothing at all, the software may have audio level normalization and frequency shaping built into the code that acts as a modulator, and most likely does.

It's not a UV-5R problem in specific (except for the problem with the too small microphone holes), I get complaints all the time that my Motorola mobiles have too low an audio level, and that in a conversation with someone with a Japanese mobile, it's a problem.

I was recently congratulated on fixing my audio, now you don't have to adjust the volume between me and another frequent user of the local repeater. I did not do anything, he replaced his Japanese rig with a Motorola, and although we are both lower, we are the same. :-)

Date: 2012-08-21 15:03:39 UTC
From: rogueeve
Topic: 6593 Message: 6593

Hey guys, great group and I love this radio! So much I bought two! I have a question about what kind of range you all are getting on simplex going HT-to-HT. I tested it out with my wife yesterday as I ran to the store and was expecting big improvements over the FRS walkie-talkies we used to use. Unfortunately I didn't even make it to the mailboxes (about 1000 feet) before 2-meter started breaking up and I lost contact on 440 within 1500-2000 feet, before I even reached the first intersection. This is straight Baofeng to Baofeng at HIGH power on the stock antennas. I stopped numerous times and called on both bands, even stopping on a hill about 1/2mile from our house, getting out of the car and standing up on the bumper to get the antenna as high as I could and no contact.

I'm a pretty new ham, so I don't know, does 2m simplex really suck that bad, are there too many obstructions (there's a few trees but nothing major), our radios no good or do I need to get rid of those little stubby antennas that come with the radios? I can often hit a repeater about 5 miles away with no problem so I was expecting at least a mile or two radio-to-radio, even given obstructions, radio horizon etc.

Would going with those longer floppy whip antennas I see on eBay get me that kind of range? Or would I have to put up like a real base station antenna and hook one of them up to that?

6594. Whats the difference? or should we care? half a dozen of one or six of the other

If you expect to be able to talk inside the car to inside the house,
using just the rubber ducky antennas, you've gotten fairly good results.

The UHF signals will go farther, because they will get into the house
better, and the rubber ducky antennas are better at UHF than VHF because
of the larger size in relation to wave length.

4 watts is 8 times 500mw, so all things being equal (which they never
are), the UV-5R should have about 3 times the range of the FRS radios.

You can make a big improvement in you distances by mounting an external
antenna on your car, and one on your house. You can make smaller, but
possibly enough improvements by buying a better "ducky". This subject
has been talked over recently read back through the archives to get an
idea of what to buy and why.

What I would do if I were you is sit your wife down on a comfy chair
outside of your house, away from any obstructions, walls, overhangs, etc
and then drive a bit, get out of the car, do a radio check, make notes
and then drive on.

If you can, try it in more than one direction. This will give you a good idea of how far you can go and where there are "dead spots".
Note any point where although you don't hear anything, there seems to be a signal received. It may be blocking your receiver.

The UV-5R do not have very much off frequency filtering.

I have not done my experimenting, and the one test I did that worked, I was able to get 2.7KM (about 1.9 miles) using two UV-3R at 2 watts, and $11 "better" ducky antennas. YMMV. The other tests were much farther and did not work. I no longer live there, so I can not repeat the tests.

73,

Geoff.

As stated, it's a $50 radio, probably worth about $25. It's fun to play with and totally not worry about dropping in the mud, the lake, etc. I've found that with an external antenna I can hit repeaters 15+/- miles away, and I'm in a valley here. With the little stubby duck, I'm lucky to get a half mile.

The UV-5R has never been capable of the 200mhz band, its just not capable of it.... nor was it capable with the chirp memory hack.

The point of this is to allow you to punch your frequencies in the field and not have to use chirp to add out of band freqencies

Topic: 6593 Message: 6605

Power is the least effective way to improve distance, whereas antenna, and height of at least one station changes things dramatically, I can hit repeaters from indoors to about 10 miles, but one repeater at least is 1000ft above sea level, and that only transmits 5 watts. Satellite communication is possible with sats tx at 1 watt, because there is nothing in the way so to speak that will block the signal.

Subject: [baofeng_uv5r] Simplex Range

Hey guys, great group and I love this radio! So much I bought two! I have a question about what kind of range you all are getting on simplex going HT-to-HT. I tested it out with my wife yesterday as I ran to the store and was expecting big improvements over the FRS walkie-talkies we used to use. Unfortunately I didn't even make it to the mailboxes (about 1000 feet) before 2-meter started breaking up and I lost contact on 440 within 1500-2000 feet, before I even reached the first intersection. This is straight Baofeng to Baofeng at HIGH power on the stock antennas. I stopped numerous times and called on both bands, even stopping on a hill about 1/2mile from our house, getting out of the car and standing up on the bumper to get the antenna as high as I could and no contact.

I'm a pretty new ham, so I don't know, does 2m simplex really suck that bad, are there too many obstructions (there's a few trees but nothing major), our radios no good or do I need to get rid of those little stubby antennas that come with the radios? I can often hit a repeater about 5 miles away with no problem so I was expecting at least a mile or two radio-to-radio, even given obstructions, radio horizon etc.

Would going with those longer floppy whip antennas I see on eBay get me that kind of range? Or would I have to put up like a real base station antenna and hook one of them up to that?

Could fix? I suppose, for some definition of the word. Will fix?
Probably not. Uploading an image of the radio is _supposed_ to be a full
brain dump. Getting selective about it is not really a can of worms I
want to open.

I took a quick look at the Uv5R schematic from our files list. The Vr3 is connected to pin 7 of chip TDA 2822. I pulled up the data for this chip,a low voltage power Audio Amp. Pin 7 is one of the inputs to this chip. This is as far as I can take this,as a certified tech, but there are surely others in the group who are much more advanced than I.

This device is an amplifier for the audio output. The pot Vr3 in question adjusts the input to the amp.

Hope this helps,
K4BBW

Make sure you hold both radios so the antennas are parallel. This could be vertical or horizontal. My experience with 5 watt HTs with 5 inch antennas on VHF includes 5 miles apart on a flat highway. Both worked great with both antennas parallel, vertical or horizontal. Hold one vertical and one horizontal and no signal. Hold one slightly off the polarization of the other and signal is weaker. I have also tried to talk thru a 200 foot mound of earth with 1 watt HTs. No luck. When we got to where we could almost see each other we could communicate. We were about 2,000 feet apart with the mound in the middle. - Jerry WA5KZA

Hi Rogueeve,

Well, hard to say if you have an actual problem, or not, cause I'm not there looking over the topography. But you must remember that VHF-UHF is line of sight (LOS) communications. There will be some small exceptions to this caused by the "scattering" of the signal as it encounters objects, but scattering and absorption occur together.

That is the basic reason for repeaters... reliable communications without LOS.

Did you mean close that window, or close the program? It is a failing of the Baofeng software that it does not remember your selected COM port from one session to the next. (It also forgets that you don't read Chinese.)
But you say there is no "Confirm" button on that window,... there's supposed to be. My first reaction would be to re-install the Baofeng software from the latest version you can find in the FILES section of this group.

I had similar issue a week back. You most likely need to go to the comport list and move com 4 to any available port, of course not com one. Now you must make sure that com 1 is available and free. So now go ahead and do a restart of your computer and watch for confirmation near the clock in the lower right hand corner of your monitor.It should show something like driver updated to com one. If it shows then you are are good to go and make the port one change in the baofeng software. PS. I am presuming that you are using windows Vista or windows 7 >>>>Frank KJ6KHF

Rodney,
I'm pretty sure Baofeng doesn't ship the UV-5R with software. What you have is most likely something your dealer put in the package.

Long story short, it appears to me that the included software was the initial version that was available from Baofeng. I believe that it behaved exactly as you describe.

What you need to do is remove it and replace it with the correct software from the files area of this group. Look for either of these files.

UV_5R_P 20120425.rar [commonly called version 2]
BF5R_VIP_CPS.rar [the VIP version]

They both need to have the com port configured every time the software is launched.
The VIP software needs to be set to English every time.

This radio will not allow you to shut off the second band, but you can program your desired channel into a memory channel, use that memory channel in Band A, program some channel you will never use into another channel memory, display that channel memory on Band B, set menu #7 TDR to "OFF" and leave it at that.

You will effectively end up with a single-channel radio.

Seems it would make more sense to just program the same frequency into both channels....although, I don't think anything stops someone from changing it afterwards manually off the keypad.

From: wb8grs
Topic: 6598 Message: 6629

According to the schematic in the file folder in this group, there are at lease 3 pots in the UV-5R (there many be more I did not check for more after finding the 3 pots).

VR1 - Fine adjustment for transmit/receiver frequency
VR2 - Automatic Power Control for the RF output
VR3 - Volume control the user adjust on the outside of the radio

I'm not sure if it's VR1 or VR2 behind the CE black sticker, but I seem to recall another post saying that pot was VR1, but I'm not sure.

73,
Steve - WB8GRS

If all you are trying to do is keep the user from programming the UV-5R via the keypad, this is fairly simple to do. You will always be able to (re)program the HT via software.

You need CHIRP to do this. You might be able to do this with the Baofeng VIP software but I don't have time to test it right now.

Here's what you do...

Program whatever channels you want into CHIRP. One channel or 128 channels. It doesn't matter. VHF only, UHF only or a mixture. It doesn't matter. You might want to upload them first and test them out.

Once you are happy with you channel setup, Select the CHIRP Settings tab and then the Other Settings tab. Now here come the hard part...

Set the VHF Upper Limit lower than the VHF Lower Limit and then do the same for UHF.

Any frequency that the UV-5R user tries to type in while in frequency mode will be cancelled. They could do a Menu 40 Reset and delete all of the channels but they won't be able to put any back in.

You'll have to use the software again to do that. I hope that helps.

Thanks. I was just looking out for those that think the [6 key] + power-on message has some important meaning. I don't. Back about the time CHIRP added the standard power-on message edit capability, I discovered for myself that it was easily overwritten. I realized then that its purpose, whatever Baofeng meant for it to be, was no longer.

I immediately hacked mine to say something else and it has been that way ever since. So if I was looking out for me instead of anyone else, I would ask to add the 6 Key Power-On Message 1 and 6 Key Power-On Message 2 edit capability right under the exiting Power-On Message editing feature.

But I won't ask because mine is already changed so I would rather have you work on something I don't have. I just need to find the time to figure out what that feature is and request it.

And in closing, I just want to thank you again for CHIRP.

Jim,

I have noticed that using the VIP software that the second line of text is shown first and the funny numbers along with Ver-05 display after, so nothing is lost here only added to.

I also was working on the limited frequency thingy with the BF software and it will not allow a lower frequency to be inserted in the manner you suggested..... that was going to be my first answer too. Then I went to Chirp and I must have an older version there as what you suggested was not available so one would have to have the latest builld.

John,

Hmmm. I don't see that behavior with my VIP software. After I read my UV-5R my Amateur callsign is at the top and my GMRS callsign is at the bottom, the same as in the HT (maybe its because I'm left handed ;-)

I used to recommend the latest CHIRP Daily but based on a recent posting by Dan, I changed my policy. I now recommend the most recent CHIRP Daily for which a UV-5R feature was added or a bug was fixed. So currently my recommended version of CHIRP Daily is v120730.

Fellow Hams,

This will be my first radio as a new Ham and I am not very savvy about where to purchase this radio. I normal do not buy online but I see this is where the good deals are. Can anyone recommend a online outfit and advise me of any pros and cons? Additionally, if i am going to need any accessories or upgrades i would like to get them out of the gate so everything arrives at once and i am ready to rock-n-roll. Thank you for the assist here!

I suspect several (many?) here will say I don't know what I'm talking about, but I would really recommend AGAINST these radios as a first radio. Given all the issues these radios have had, and oddities when it comes to programming and operation, you run a high risk of being soured out of the hobby quickly if this is your first introduction to the world of ham radio.

I'd really suggest going with one of the big brand names (Yaesu, Icom, Kenwood, Alinco, etc) as a first radio so you're not dealing with these issues while trying to learn how all this stuff works. You don't have to drop several hundred on a radio either. I picked up my Yaesu FT-470 HT off Craigslist for less than what the UV5R cost me, and it's a breeze to program/operate compared to the Baofeng, ESPECIALLY when programming out in the field from the keypad.

I bought mine from radioshop888.com on ebay for $48 shipping
included. They were OK to deal with. I had a problem and they stuck
with me thru it (plug on programming cable needs to be pushed into
the UV-5R HARD.

Most of the stubby ducks I've tried contained - as far as I could tell - no radiating element at all. SWR across the board was infinite.

However I do have two BNC ones purchased a couple of years ago that I can open a repeater more than 50 miles away using 4 watts. It's a nice party trick, opening a distant repeater using an antenna 2 inches long, but my signal is not strong enough to have a qso through the repeater.

The HH-S518 does work but it's still a few dB down on the other ones.

I wonder what is the furthest anyone has worked using a stubby antenna?

Julian, G4ILO

>
> As stated, it's a $50 radio, probably worth about $25. It's fun to play with and totally not worry about dropping in the mud, the lake, etc. I've found that with an external antenna I can hit repeaters 15+/- miles away, and I'm in a valley here. With the little stubby duck, I'm lucky to get a half mile.

I've said it before, the stock Baofeng antenna as shipped with the UV-3R+ and UV-5R is as good as you'll get in a 5 inch long antenna. It doesn't look much and it's not very flexible but anyone wanting to improve on it will have to be prepared to put up with something much longer.

ok, just got an rh701 from a local who says he only sells genuine diamond antennas. mounted it on my uv5r and it doesn't screw down flush into the radio... there's a slight gap of about 0.5mm.

comparing the screw-in plugs of the original antenna vs this rh701, this rh701 is likewise longer by 0.5mm due to a lip (for self-centering?). so...

(1) is the rh701 i got a fake or does the rh701 have fit issues with the uv5r? anyone here using the same antenna with their baofeng?

(2) i'm thinking of shaving off that 0.5mm lip. good idea?

(3) or put in a rubber washer on the radio plug side to take up the gap,what size washer to use?... it seems a bit odd sized though, plus the washer wouldn't sit flush because of the 3 protrusions around the antenna plug in the radio?

oh yeah, i've thought of getting those $4 antennas but i've had one too many bad experiences with the custom leeches at the local post office... greedy bastards slap as much as 400% duties. same as paying fedex?

Just as a follow up, despite testing on many computers I failed to get this cable to work. I asked nicheone, the eBay seller, who sent me detailed instructions in Chinese in a word document (with English overlays) but still no go. So very generously he's sending me another one.

Hopefully this will work. :)

Maybe the flashing red led Tx light is a clue it has gone wrong?

While I have not purchased from importcommunications I understand they have a top notch reputation from other buyers here.

I have purchased from ebay sellers 409shop, radioshop888, and solidradio, with good service from all three. One of the two UV-3Rs I purchased could not be programmed. Solidradio asked only that I first try a reset before sending it back, and outlined how to do a reset. Still the same, so they gladly exchanged the radio.

I can recommend all three of those ebay sellers.

Hello all.

I'm a total newb. Planning on testing for my technician license next week. I picked up a UV-5R on Amazon and it came in yesterday. I programmed it well enough to listen to a couple nets last night.

The one problem I'm having is with channel scan. I've used the guides to create a channel. I can go into channel mode and turn to the channel. When I put the radio into scan mode it scans the original channels but not the channel I added. (I have it set as channel 010). From my experience with police radios it seem like the channel is what we call "punched out". Regardless of what it's called I've searched around and I haven't seen anyone post about the same problem.

Any help appriciated.

Topic: 6635 Message: 6664

My first UV-5R was from eBay seller nicheone, and was sent from Amazon. They sell on Amazon, it was a few bucks more.
My second I just received from radioshop888, I think. Came from China. Got a good deal with the 3600 mAH battery included. That radio had bad soldering on the PTT button, but I'm not trashing the seller, nobody puts out 100% perfect products.

With that said, if the possibility of needing warranty work bothers you, paying a few extra bucks for a US vendor will save overall time. Had my second UV-5R been a US vendor, I'd have sent it in for warranty. I've got several speaker mics, so I'm living with it until I practice soldering more and fix the button.

So far as the radio not being for a first ham, it depends on you. If you like to play around and tinker (which a lot of hams do) then I don't see a reason not to get this radio, especially at this price point. Plus, when you expand your collection of radios, you'll have this one for situations you don't want to bring along a $200+ HT if there's possibility of damage or loss. Another strike against the UV-5R is if you'll be working in an area with a lot of radio traffic. It doesn't like close signals.

Yes, manual programming is no fun, but it can work fine. A programming cable makes life a lot easier. I think the UV-5R is a fine first radio if you don't need a guaranteed bulletproof radio right off the bat. Yes, the UV-5R has some weird quirks, but $50 makes up for a lot of them.

Hope this helps,

73

Thanks Alek,

You hit in on the head for me. I am a new Ham but prior Avionics type (GROL) and love playing with switches and dials. This sounds like a perfect toy thay will be cheap but require enough engagement and learning to fit all of my neesds. Plus it will fit the fun factor!

Set Menu#7 to On and Menu #34 to your liking Off/A/B. #34 cotrols which channel you will transmit on. This all really controls Top (A) or Bottom (B) settings.

These settings can be done from the software also and you radio will come up in that mose. The BF software controls it "Under BDR *".

Check your scan setting- if it on SE and you have a continuous signal at the 7th position it will stop there- Maybe a Wx channel or just noise. Try setting scan to TO- 2 sec hold and then continue scan.

Huh. My 771 works GREAT, and even better than the stock antenna.
Perhaps I just got a good unit?

Then it would most likely do more good to turn up the audio here than it would to try and enlarge the mic hole in the case.

One might even be able to get the deviation up to a true 5KHz which would be GREAT!!!!!!!!!! As Tony the tiger would say.

I think this is audio out to speaker not transmit audio as far as the amp circuit is concerned, i'm happy for anyone to show otherwise.

I'm going to take a short walk down memory lane.

When I got my license in 1975, we had to wait MANY weeks for the license to come in the mail. Meanwhile, I had purchased a radio and crystals (!), installed it in the car, put the microphone in the trunk, and listened all the time.

When the license arrived, I opened it, signed it, got the microphone out of the trunk and plugged it into the radio, then nervously transmitted my call sign on the local repeater. The rest is history.

End of walk down memory lane.

I enjoy my UV-5R. I have no complaints about the antenna, the power out, the display, or anything else. It does exactly what I want it to do. I am very lucky!

After looking at the schematic, I feel safe in saying that VR3 is the volume control on top of the UV-5R.

There are NO adjustments in the mic (audio IN) part of the radio.

Don't know what DAO stands for on the schematic but VR2 is in this line.

VR1 is off pin1 circuit of crystal CY2 so guess that could be a deviation adjustment.

6686. Service Monitor Test Results

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-22 19:34:34 UTC
From: va6lm
Topic: 6686 Message: 6686

We just received our UV-5R radios yesterday. From my good friend VA6RS: Just hooked up my new UV-5R to my service monitor and ran it through some tests:

f = 146.5200 MHz
Receiver 12 dB SINAD = 0.14 uV
Receiver Squelch (with squelch menu setting at 3) = 0.06 uV
Transmitter Power Output (Low) = 1.5 Watts
Transmitter Power Output (High) = 4.5 Watts

f = 446.0000 MHz
Receiver 12 dB SINAD = 0.13 uV
Receiver Squelch (with squelch menu setting at 3) = 0.08 uV
Transmitter Power Output (Low) = 1.4 Watts
Transmitter Power Output (High) = 4.3 Watts

My spectrum analyzer is out on a job, but when I get it back I'll run a transmitter spurious/harmonic test on the radio too.

These numbers are VERY good! The receiver is super sensitive! A typical "YeaComWood" hand-held receivers spec out at 0.32uV on 2m and 0.16uV on 70cm - and they "fudge" the results by using 3.5kHz deviation in the SINAD test (it's supposed to be 3kHz - and yes, a FM receiver will receive a high deviation weak signal better than a low deviation weak signal).

For a $50 radio, the transmit & receive performance is equal to (if not better) than anything else out there.....

Thanks for the data. I have checked a couple of 5Rs, a 3R MKII, and KG-UVD1Ps and they were all very good on Rx sensitivity. There have been a number of recent postings about weak Rx and I wondered what they were doing wrong, because I find all the LCRs Rx to be really good.

I ordered one of these with a BNC connector. I received my BNC to SMA adapter today and had a chance to try the antenna. WOW! I love this 270A. Noticeably better reception than either the stock antenna or the NA-701. Especially in the 70 cm range.

It is heavy. But with the 3600 mah battery package on the HT seems better balanced. The base is spring loaded which makes me hope that the SMA connection will survive a few bumps.

I agree with Eric. This is a great radio, but not the best choice for a brand new Ham. There is risk of transmitting out of band, and keyboard programming is not as straightforward as a dedicated HAM rig.

My first radio was a Yaesu FT270; while more expensive than the Baofeng 3R or 5R, it is a HAM rig, monoband, and straightforward to operate. It also is water proof to something like three meters, so if you drop it in a pond, you can recover and use it.

Once you get more comfortable with the standard HAM stuff, you can move up to one of the more complicated rigs like the UVxR. They're fun, they're cheap, and there is little invested if they get lost or damaged in the field.

I got both my 3R and 5R at Lentini's. They are local to me, but they are also on-line and advertise in QST with several other US vendors as HAMPro's.

Bill

?

I ordered one of these with a BNC connector. I received my BNC to SMA adapter today and had a chance to try the antenna. WOW! I love this 270A. Noticeably better reception than either the stock antenna or the NA-701. Especially in the 70 cm range.

It is heavy. But with the 3600 mah battery package on the HT seems better balanced. The base is spring loaded which makes me hope that the SMA connection will survive a few bumps.

My suggestion would be to ask in the UV-3R group. Their files area has both .dat and .3r files which would indicate to me that they are more qualified to answer your question.

I plugged in my cable from my Wouxon KV-UVD1P and went to read the radio. I kept getting a message that the radio didn't respond. Odd. The cable and Chirp works fine on the Wouxon.

I was in Linux so I booted into Win 7 64bit. Same message. Unplugging and plugging the cable in several times, it finally worked. Read the radio fine. Booted back into Linux and it worked there fine also. All's well.

Used Chirp to import my Wouxon file into the Baofeng. Worked great. I also ordered a Waccom for 409shop and still I'm still waiting for it.

What a nice little radio. I like it better than the Wouxon. Going to go donate a few bucks to Dan for his Chirp work.

Just received the UV-5R today and am using the CHIRP software to program it. I don't seem to have any problems programming repeaters but I am not able to program the local sheriff's department frequency.
all of the frequency's are in the 483 to 485 Mhz range and I am able to receive a carrier wave when they are transmitting, but no modulation. I have set the upper limits of the radio to 500 Mhz in the software but just cannot receive voice on anything above 480. Any assistance would be greatly appreciated. Have a great day!

I have done about 41 miles with 1 watt and stock antenna. It is a 70cm repeater. I was working another ham that had just found the repeater, he was using a beam. I asked him to try an HT from his QTH and I could not tell the difference between his rig and HT.

Height is might.

I am new to this group and just checked the tracking info for my radio. I ordered it on eBay from nicheone and just noticed today the tracking information change to show a scan in Chicago. My new Baofeng is almost here! Purchased on the 8th and showing acceptance on the 11th, then at the sorting facility in GUANGZHOU, China on the 12th. Now Chicago on the 22nd. Living in Nebraska, I would imagine I could have it by Friday or Saturday. I guess the lesson here is patience if you order directly from China. When they say it could take a month, you better believe it could! BTW, this is not the fist time I have ordered from China. Some shippers are faster and others and I have had things take way less time and way more time. I guess I would suggest a US seller for a few bucks more.

I would like to add that the information I am getting here before having my radio in hand has helped me prep for problems, programming and modification. Thanks to all who have added technical and programming suggestions. I believe I am now prepared to operate this rather complex little radio.

Just got my UV5R this past weekend at the Denver hamfest. I have read many of the posts about the USB drivers for a programming cable...

Is there a reliable source for a cable that works out of the box for Win 7 64 bit? Or does everyone buy one of the $8 cables from eBay and load an older driver on their PC?

Assuming you don't have an old-style serial port, buy one of the USB cables and use the older driver.

If you have a PC with an old-style serial port, you can side-step the driver problem by buying the serial programming cable.

Or you could use your own USB-to-serial converter (that hopefully you know works fine) and buy the serial programming cable.

The cheapest route is just to get the USB cable and follow the instructions. If you start clean, you should have little problem.

What mode are they transmitting in?

I suspect they are encrypted.

If they are, this isn't a chirp or radio issue.

Topic: 6635 Message: 6719

Well here goes, I often see things from a different angle and often have to explain in great detail my views so that folks understand.

I purchased the UV-5R to learn with. The is a great little radio with many opportunities to learn about several facets of and having to do with the Ham Community, radios, computer programming, interface cables, antennas, offsets, repeaters and I don't know what else. I do know that for the last 4 months I've had the opportunity to meet 1,000's of people from all over the world and gained knowledge from these contacts.

I guess that I look at the UV-5R as the "Heath Kit" of days gone by. It is not quite ready to use when purchased and for that I'm grateful because I learn more when I have to "assemble" before use. I could have purchased an 857D and it would be ready for the world but I know that I would not have had more enjoyment than I've had with this LCR.

So the bottom line is..... if you want out of the box 100 watt, I can talk anywhere, anytime go for the big name units. On the other hand if you are trying to learn about his hobby then the LCR is a great way.

My opinion,

JL

I ordered both my UV-5R's from Chinese sellers and have had no problems with them. It's a Chinese radio so they all come from the same place. The US sellers are just ordering from the Chinese sellers and then charging you more for the convenience of getting it sooner.

I wouldn't worry about it being in China. If they say "as is" though, that would be odd. It's common on eBay for there to be no returns, but if the radio arrives broke they should definitely be willing to make it right. Most Chinese sellers I've dealt with have been really willing to fix any problems. Then there are a percentage that are selling cheap crap that instantly falls apart. You just have to learn what to look out for and you can get a lot of pretty decent products for cheap.

programmed by keypad...just changed my MDF-A & B to frequency from name and it now works... don't know how the "name" got set in there...must have been the "reset all" I did in the beginning that took me to chinese voice!!Q!!

thanks to everyone for your help ...

regards,

No returns, at least in eBay terms means that once you buy it, it's yours. You can't stick them for the item if you have "buyer's remorse", or find it cheaper elsewhere.

The Chinese vendors live and die from feedback. Every time they get a negative feedback, eBay gets upset and their eBay fees go up. Every PayPal dispute and their fees go up there.

To many disputes or negative feedbacks, and they lose their account and are banned.

It's a business that makes pennies in profit, so they are willing to go to great lengths to prevent it.

Some vendors are not so nice, I won't buy from jack at 409shop, but have had no problems with their other sellers and their website.

Make sure that you do not leave any feedback until everything is resolved. Test the radio and the accessories you bought, if they are ok, leave positive feedback.

If they are not, contact the vendor right away, but don't leave feedback until things are resolved.

Don't leave negative feedback until you are sure they won't "make things right".

Once you leave feedback, your chances of getting something resolved are lower. Though several times I have found hidden defects after leaving feedback and most vendors will go out of their way to fix it.

Don't be frightened off by the cable issues, it's NOT a baofeng problem, it's a problem which I've explained on this list several times and other people have gone to great lengths to document how to avoid it and get out of it.

It will be the same no matter what radio you get if it uses the same cables, e.g. Kenwood, Yaesu, ICOM, Wouxun, and a lot of other Chinese

brands.

Congratulations on getting your license.

You can not get that call for two reasons.

The first is that it is still valid. The FCC regulations allow, but do not require, the use of FCC issued CB callsigns on the air (on CB). They no longer expire.

Since they are valid callsigns, you can not legally use them on any other radio service, licensed or not. So you can't buy a set of FRS radios and use them there, or on GMRS, MURS or ham bands.

Second, ham calls are prefix designating the country, the US got many, K,N,W and part of the letter A, a number and at least one letter. The most notable exception was the late king Hussein of Jordan who granted himself JY1.

At one time the number was related to where you live and if you moved you had to get a new callsign with a new number if you no longer lived in the FCC district that it covered. That is no longer the case, with vanity callsigns, you can get any district and prefixes reserved for other parts of the country.

So you could get if it is not in use, K3DM, KD3M, and so on.

Geoff.

My suggestion would be to ask in the UV-3R group. Their files area has
both .dat and .3r files which would indicate to me that they are more
qualified to answer your question.

I just want to say one thing here. Your post is a little misleading. A Technician class CAN NOT GET A 2X1, OR A 1X2 CALL. Such as K3DM or KD3M they are for Extra class only. As a Technician or General he can get a 1x3 or 2x3 only.

The cable. I actually ordered mine after searching for Kenwood cables. Baofeng, at least when I looked for it wasn't generating nearly enough results.

I don't think so. Ham calls in the USA only have a single digit based on call area you were in when getting the license. You might be able to get something with the KDM suffix.

41 Miles is doable, hand held to handheld, but it would be pure line of sight with no obstructions and it would have to be mountain/hill top to similar.

I'm a little confused by what was actually proved here and if it was really what we think it is. Map out the distances using RadioMobile and we can calculate the actual path loss.

Israel,
Make sure you are getting a developmental version (aka CHRIP Daily). I currently recommend this one...
http://trac.chirp.danplanet.com/chirp_daily/daily-20120730/
There is more than 1 file available for download to support different operationg systems. You should get the file that ends in .exe. After it is downloaded, double-click it to install it. Then just launch it from the CHIRP shortcut in your Start menu.

Glad you got it sorted out. Thanks for reporting your solution. I'm pretty sure that someone else had this same issue and I don't know if it was ever solved. This should probably be added to the FAQ.

The channels not scanning didn't make sense because you can't set a channel not to scan from the keypad. Who would have thought that the setting of menu 21 and menu 22 would make a difference since you can't enter channel names from the keypad either. But we all know the UV-5R has some very peculiar behaviors, so why should this surprise us.

I just did a 'reset all' on my HT and the MDF-A & B settings were retained. But that could be a firmware difference (mine is the older English only firmware).

Line of sight is key here. I was sitting on my front porch. I am at a little over 1,200 feet. I am the second highest peak in my area. I can eyeball the mountaintop where I believe this repeater is located from my porch. What is nice is I do not have to worry about the radio heating during extended QSO's.

There is a linked repeater to this group located on top of the hospital in my town. I struggle to hit this repeater from my QTH because there is a ridge between us, also the hospital elevation is much lower than mine.

I understand that I am in the minority when it come to operating environments. Radio stuff played a major role when I chose to purchase this house. I have a clear path to the north and south of me. The Blue Ridge mountains obstruct to my west and I havve minor obstructions to my east.

I hope this helps. I will get an exact "Crow flies" distance shortly.

err.. could that be because you are getting the repeater signal and not his signal (beamed or not) to the repeater? I've often heard people give signal strength reports on repeaters which is dumb to say the least.

I have done about 41 miles with 1 watt and stock antenna. It is a 70cm repeater. I was working another ham that had just found the repeater, he was using a beam. I asked him to try an HT from his QTH and I could not tell the difference between his rig and HT.

Height is might.

Andy

I do think that is what Andy was saying. The fact that the guy dropped down to an HT and there was no difference was his point. Simplex itself is a questionable question to say the least.

Height and antennas are the two most important parts of the equation and I think in that order. Given 2 units High/High= Great Range, High/Low=Good Potential Range, Low/Low=Unpredictable Range

err.. could that be because you are getting the
repeater signal and not his signal (beamed or not) to the repeater? I've
often heard people give signal strength reports on repeaters which is dumb to
say the least.

OK guys I went to Radio Mobile Online. It took me a bit to figure it out. Very cool site and tool.

Yes John it is in the Three Dog Group. 444.175 MHZ. I have problems with the local 444.3 due to obstructions. As I stated I can see Poor Mountain from my porch.

Straight line distance: 61.6 Km about 38 miles.
I am at 1,200 feet. Poor Mountain is 3,927 feet.

Free space loss 121.15 dB Obstuction loss 22.61 dB Forest loss 1.00 dB Urban loss 1.00 dB Statistical loss 6.11 dB Total path loss 151.87 dB
*Performance
* *Distance* *61.660* *km* Precision 30.8 m Frequency 444.175 MHz Equivalent Isotropically Radiated Power 1.995 W System gain 147.52 dB Required reliability 70.000 % Received Signal -117.37 dBm Received Signal 0.30 µV *Fade Margin* *-4.35* *dB*

As an afterthought, I may need to redo the gain. I thought i had put no gain in the data.

Olá, David - W4DSM,

Muito Boa Noite,

Solicito a ajuda de algum amigo para nos faça uma tradução do português-Brasil, para o Inglês, uma vez que também tenho muita dificuldade.

O resumo do erro que estou apontando para os HTs Baofengs, é o seguinte :

Na minha opinião, um erro de projeto, que nos incomoda e muito:

Estando nossos HTs trabalhando no Scan, seja em VFO como na banda Memórias, o display dos mesmos só se acendem quando a portadora vai embora, sendo que deveria ser o contrário, ou seja, quando eles encontram uma portadora é que o display deveria se acender para que pudéssemos verificar qual frequência foi encontrada a portadora.

___ De que nos vale vermos o display aceso, sobretudo a noite, depois que a portadora desaparece e o Scan continua ?

___ Espero poder encontrar um amigo que possa traduzir esta minha observação, de forma correta para o inglês.

___ Agradeço a todos, antecipadamente.

2012/8/23 David <david480@...>

Google Translate gives:

Very Good Night

I request the help of a friend to make a translation from Portuguese-Brazil, for the English, since they also have a lot of difficulty.

The summary of the error that I am pointing to the HTs Baofengs, is as follows:

In my opinion, a design error, and that bothers us a lot:

With our HTs working on Scan, whether as VFO Memories in banda, the display of these only light up when the carrier goes away, and it should be the opposite, that is, when they find a carrier is that the display should light up so we could see what the carrier frequency was found.

___ What is worth seeing in the display lit, especially at night, after the carrier disappears and continues Scan?

___ I hope to find a friend who can translate this my observation, correctly into English.

___ I thank everyone in advance.

6750. Stored Frequency Scanning - Skipping memory locations ??

Hi, anyone else having this problem? I saw the thread from "uofa197"

His solution was -

Programmed by keypad...just changed my MDF-A & B to frequency from name and it now works... don't know how the "name" got set in there...must have been the "reset all" I did in the beginning that took me to chinese voice!!Q!!

- I have the same setup, programed by keypad. His solution does not work for me. I have 7 frequencies stored only the first 5 are scanning. Very odd. No stopping just looping 1-5 skip 6 and 7 entirely. Any ideas?

Thanks,
Rob

Are you able to call up and use the two channels that don't scan?

> that handle...will vanity call signs allow this?

I've seen a couple of other answers (which are good), but I'll post my response anyway.

Simple answer: negative.

More complete answer:

You will be issued a regular series call sign based on your U.S. mailing address. Probably a KJ#xxx, where # is the call sign area and xxx are three letters.

(Google "call sign area map" to see what numeral you will get.)

After you get that call sign, you may consider applying for a vanity callsign, which could be a variety of combinations: W#xxx, W#xx, K#xxx, K#xx, N#xxx, N#xx, and maybe some others.

You will notice that W#xx is called a "one by two" and W#xxx is called a "one by three."

You could go for your initials or some other letters that mean something to you, or maybe W#KDM or K#KDM or N#KDM or maybe you could go for K#DM if it happens to be available.

Dave Schultheis
WB6KHP San Jose

my original call sign was issued in 1975

One very handy use of this function is finding out if you are in simplex range of a station. Sometimes you have a bootlegger jamming a repeater. This can help to locate the area the signal is coming from.

Ok, so you can hit reverse and hear the incoming signal instead of the repeated one.

Put a Yagi on and you're on bootlegger fox hunt. Makes sense. Thanks for clearing that up.

6758. USB/Serial cable driver install

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-25 03:47:09 UTC
From: w7spy
Topic: 6758 Message: 6758

I'm having a terrible time installing the Prolific driver using the software supplied with the cable and also Prolific driver software I've downloaded from the net. I once had the driver show up in the device manager, but could not get it working the next day. Since then I've tried to install it on one desktop and three laptops all running WinXPpro/sp3/updated without success. The software seems to be installing correctly, but the Prolific driver does not show up in the device manager and the system does not see the cable when inserted.

On the one time I did see the Prolific driver listed (@com3) on my wife's laptop, Neither CHIRP nor Baofeng software would talk to the radio. I've read the FAQ & files here @ Baofeng-UV-5R. Any advice or suggestions would be appreciated. Doug w7spy

I had this problem. With XP it is my understanding that once a proper driver is installed, you are OK (don't have to worry about your OS "updating" it for you). So simply get a copy of the old Profile driver, install it, and you should be good to go. BUT, in my case, I had to be sure the cable seated correctly into the radio. To do this, be sure it is inserted with all the force you feel is safe to use. Then if it still doesn't work, try a bit more force. That seemed to work fine for me.

Good luck! 73 de Dave

The guides in the Files section helps most people through. If you're still not seeing your driver in Device Manager then this might help. (It may or may not be YOUR issue, but it has helped a few folks,...)
Sometimes a driver will not uninstall cleanly when you try to get rid of it in favor of another one. Perhaps there are specific ones that cause this difficulty--I don't know. But myself and other guys have had the "correct" driver on our systems, but still couldn't see or select it. There was, for lack of a better word, shapnel left in the way from badly uninstalled drivers.
Download Revo Uninstall Pro. It is free to try for an initial period and not crippled during that time. Use that to completely uninstall anything remotely resembling a Prolific PL2303 device driver. Then install one of the drivers from the FIles section and it should work.

I thought I'd just do a quick post to let you know the results of a non scientific test I've just carried out.

I'd been using a cheap dual band mini mag mount mobile on my car (from Maplins) with some success. It wasn't bad for its size (very unobtrusive) and it only cost £20.00 but it lost repeaters if you went behind dense tree cover or slight hills. From my drive way at home I could hit 3 local repeaters ranging from 12 - 22 miles in distance.

I've just rigged up a Sirio HP207H with a mag mount that I purchased second hand from Knights in the UK for £25.00

The difference is quite considerable (as would be expected).
I can now hit 7 repeaters from my driveway and the signal received is very clear - whereas the old antenna pulled in quite a bit of noise.

I'm really pleased with my UV-5R's (I have 4 of them!) but this has just taken things to another level.

It shows that a decent antenna is just as important as the radio you are using to work it with!

I have read a few comments about pushing the cable firmly into the radio, I did this and it still did not work. I found that I needed to push the cable in at the strain relief not the center of the plug. This pushed it in at a slight angle and made the connection. Give it a try and post the results. Good luck.

Hey all, this is my first posting to the list.

since this is a ham/amateur list as stated in the description on yahoo, I'm surprised this question has come up, but I'll answer it.
The reverse function is used to put the radio into receive mode on the transmit frequency, when a repeater pair, IE, a separate transmit and receive frequency pair have been programmed into memory or are entered into the VFO.
It is useful for checking the signal strength of a station that is transmitting through a repeater for both a true signal report from your location, and sometimes to check to see if simplex, that is, radio to radio communication is possible between yourself and the other station.
I'm not going to get into what repeaters are and why you use different transmit and receive frequencies, I suspect that is for a different list entirely.
Also, read your UV5R's manual or download it from the net to get a description of what you can do with tx and rx frequencies.

Alex asked about the "reverse" function:

> What does it do?

Besides the uses already suggested, "reverse" is a good way for you and another station to determine if you are within simplex range, so that you can both QSY ("change channels") to a simplex frequency to carry on your conversation, rather than continuing to use your local repeater.

This can be useful if you have a message for a friend but your local repeater is used heavily. Some would say that contacting a station on a repeater and then switching to simplex should be a standard operating procedure.

Yup. It's why you can CW to the other side of the globe with a <5 Watt QRP rig. If you have a suitable antenna.

Perhaps, but I talk with a friend about 70 miles away through a repeater about halfway between us. We would never be able to talk directly via simplex. To me, the purpose of a repeater is as a range extender.

The function you describe, making contact then switching to another frequency is what we have with the National Calling frequency of 146.520 mhz.

Try this:

Connect everything and start software keeping the radio off. Than go to "Program/Read from radio" and you have to turn on UV-5R just before you press button "Read".

This worked for me in Baofeng software in Win7.

I just received a Waccom UV-5r from 409shop. I took 9 days to receive. Not too bad. Some of you may already know this, but it's the same as the Baofeng. Both running BFB251 firmware.

Paul,
you are right, the main technical purpose of a repeater is as range extender. However, due to the extended "local coverage", the RPT frequency is usually used as a sort of Local Calling Frequency. And, when the stations are able to QSO in Simplex (using "Rev" function to check that), they, as a good practice, go QSY and free the RPT.
I guess those are standard (and recommended) operating procedures in most countries. Perhaps the exception would be when the RPT is so out of work that the owners do want it to be used more often.

Topic: 6778 Message: 6778

Hi all,
I just picked up 2 new UV-5R's from a U.S. seller on ebay. Both arrived within 5 days and I also ordered the program cable.

Had a few problems getting the USB drivers loaded onto Windows-XP but it was likely my fault. I have used both the factory software and also Cirp, both are fairly easy to use, but you must re-enter the com port setting each time you start the factory software.

I like the UV-5R, its a nice radio for the price and I have gotten glowing on air reports! But is there a antenna that would work better than the stock one? If so what is the recommended model and who sells it?

Thanks!

Well roger I bought a Nagoya na-702 it was much better than the stock Antenna. But I also ordered one of the 2.79 or something like that off of Ebay and it is better than both for me anyway. So for about 3 bucks its Definitely an improvement at my location.

You must clearly see that prolific drivers are assigned to port one,
It should say>>>prolific usb-to-serial com port (com 1) Then if not, you must make sure that com port one is available and clear,and not in use by anything else.

When one goes to the device manager, then look below for ports (COM & LPT). Click and open ports (COM & LPT). Now you will see a list below of what devices are connected to what ports. If you click anything on this list, then you will see a port property window. Just below there will be a tab that say's port settings. Click the tab port settings button and the next window will show an advanced button, click it.
Now you should see something in the lower left that say's com port number, now open the little slot box next to com port number. This will show you exactly what ports are in use and here you can make the needed port adjustments here. Bottom line: make sure com one is available clear for the prolific drivers.

I got my Ham ticket just a couple months ago. My first rig was a UV-5R. Attached it to a Diamond X-50AN mounted on the roof of my house, and connected with LMR-400 cable. Antenna, mast and cable cost quite a bit more than the radio. But it's a whole different beast with that antenna system.

The only problem I have is the intermod interference from some really close by public service repeaters. It makes for a lot of noise over most of the 70cm band. My new radio is a Kenwood TH-D72A and it experiences the same problem but to a slightly lesser degree. The Kenwood has a better squelch, which helps considerably.

I see it on the home page: http://groups.yahoo.com/group/baofeng_uv5r/

There's a box the says "Info|Settings" and it's in the "Info" section.

Besides that, the first paragraph indicates the ham-centric nature by
focusing on the 2m and 70cm band support.

"Discussion of the Baofeng UV-5R handheld transceiver. This model from
Baofeng sports 2m and 440 as well as wide band receive."

The radio does far more than just these ham bands.

6789. New user. Battery charge and transmission issue,

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-25 22:52:44 UTC
From: Horacio Nigro
Topic: 6789 Message: 6789

Dear friends,

My uv5r is 5 days old. My first VHF rig, bought in a local store at Montevideo, capital of Uruguay in South America.

I've decided to buy it locally, despite overseas purchases are OK, but there was a strike of Post Office workers that lasted for over a month, and I was too anxious. Funny thing is that when decided to buy the small xcvr, the strike ended!!!!

Anyways, I got a one year warranty, and the issue of am eventual defect due to QC woud be minimized.

Going right now, climbing the learning curve. Had a couple of QSO via rpt... I managed to handle with the menus and the rpt characteristics and I am now fast adjusting. But I still fail to get the most used repeaters into channel memories, which came alraedy filled.For instance, I fail entering a rpt that for instance has 82.5 Hz subtone. I've read in the group about a possible firmware bug here. Alas, most rpts here have 82.5.

The small rig didn't come with the usb programming cable, but I hope to order one.

After some QSOs today, I got concerned about an issue I experienced. Despite the Batt level indicator was with 3 narks, my transmission started to fail, just two seconds and dropped. I checked the pin of the antenna connector, for a possible false contact... but no luck. I was recommended to stop transmitting. I was using high power... Now charging the battery.

Is it possible that the powr output is limited despite the battery appears not to be almost discharged as shown thru the batt meter?.

Thanks for pointing directions...

Reset is probably easier than Deleting a bunch of channels. Be sure to program in A. Look at instructions in Files area- there is a lot of useful information there.

Reset is probably easier than Deleting a bunch of channels. Be sure to program in A. Look at instructions in Files area- there is a lot of useful information there.

I've had good luck with Jefa Tech. Here's where I'd start.

http://www.jefatech.com/product/100BNCUHFF19/Pigtail-BNC-male-to-UHF-female-SO239---RG316---19-inches.html

You probably want an SMA->BNC adapter anyway for the HT.

If you need a longer run of cable, their turn-around time is awesome and
their prices are reasonable (especially for the low-loss stuff).

If it is for use with a UV5-R or simuilar, you will need F-SMA, not BNC, for the HT.

Date: 2012-08-26 01:12:21 UTC
From: w7spy
Topic: 6758 Message: 6801

Thanks for all the observations and suggestions. I've still not installed the driver on any XP system here. I did install RevoUninstaller and uninstall the USB/serial driver with that program.

The USB/serial driver is listed as Installed Software, but does not show in Device Manager/Ports. I cannot think of how else to install the driver as WinXP does not see the serial/usb cable when inserted.

So I'm getting no error codes either as the system does not see the driver or cable. I've uninstalled the driver countless times and rebooted to install every XP driver I have found, but no joy. It would seem I'm missing something very basic here, but I don't know what it might be.

I've written to the seller who supplied the cables (China), but have not heard back. You would think at least one of four XP systems would load correctly. It's pretty frustrating after waiting for the radios and then the programming software. Any other ideas would be appreciated.

If the computer doesn't make the insert sound, the cable is no good.
I get the sound effects even if windoze can't find/install a driver
when using USB devices. Even my 4 port hub goes "ding donk" :)

Someone has posted somewhere that you should run the battery thru 3 full charge/discharge cycles before taking it seriously, as the battery needs to "break in". I have not run across this need on previous batteries, but that may be because they were already "broken in" before they were shipped. They were sure a lot more costly than Baofeng batteries.

Good luck.

mine came with 21 preprogrammed channels.
I deleted them all, but it also clears them all when you do a full, or "all"
reset with menu 40.
Just remember to set your T CTCSS tone in menu 13 before you program the
repeater into memory...as you won't be able to add the tone in later without
reprogramming the memory location which involves deleting the contents of
that memory channel.
Unless there is a way to change rx/tx tones after you've programmed
something into a memory channel?

Scott KB3JQQ... Well, that was all it took to jog my memory. Thanks so much! I remembered having difficulty installing my Radiation Detector to radiationnetwork.com, having issues with the USB/serial cable; XP made that 'ding-donk' sound on insertion.
This cable gets no system response at all.

Good thing, I bought three programming kits with the radios, so I broke out another cable and everything is working properly.

Thanks to everyone who took a few minutes to help with a problem that really didn't seem so much an equipment problem as it did operator error. I really appreciate the assistance and hope I can pass the favor on to someone else in need.

What confuses me is that batt wasn't completely exhausted when the transmission started and went off in seconds. Immediately checked for other rptrs that were triggered but couldn't get anybody to check. So decided to power off the unit and put the set to charge wherein completed it in around 4 hours. This is the time it needed to charge the last two times. Will check agn tomorrow to see if it happens once more.

Someone has posted somewhere that you should run the battery thru 3
full charge/discharge cycles before taking it seriously, as the
battery needs to "break in". I have not run across this need on
previous batteries, but that may be because they were already "broken
in" before they were shipped. They were sure a lot more costly than
Baofeng batteries.

Good luck.

it shows full battery right up until it dies from what I can tell.
When it dies, it dies, but will come back every few minutes for a brief time
then die again.
Not sure if the battery calibration is a bit wonky on these units?

Dave a Technician can not get a 1x2 or a 2x1 call. Technician and Generals can only get a 2x3 or a 1x3. So he can not get K#DM unless he's an Amateur Extra.

It's fairly standard with lithium batteries.

And if you have the voice turned off, all you get is a flash on
the screen every few seconds and the battery icon looks more
like a C then an E.

I presume that is because a LiIon battery provides full voltage and current up until the point where it can't, and then just dies? So it's more difficult to tell when it's getting close to the point where it's going to die.
Unlike a NiMH or NiCD battery that will slowly drain away the voltage until there is nothing left.
That said, cell phones use Lithium type batteries and their battery state indicators are generally pretty accurate.
Is this just a simple matter of the technology used in these radios verses what is being used in a typical cell phone?

I don't know. All of the cell phones I have had (and still do) with lithium batteries have 3 bars. (Motorola, Alcatel, Samsung). The bars are 3 bars, which means fully charged, and when new lasted a day; Two bars, which means does not need to be charged, and when new lasted as long as a week; And one bar, which meant needs to be charged which lasted a day or less.

If I actually used the phones, two bars often becomes one, and one becomes "low battery".

The older phones I had with NiMH or NiCad batteries (I've used a cell phone since 1995), had more bars, but similar results. In plain English, 5 bars with 4 going directly to 2 or 1. Originally in less than a day. At one time, long ago, I needed to be reachable by cell phone at 3am, so I had to buy a special high power charger that would both run the cell phone and charge the battery at the same time.

Bear in mind that if you did discharge the UV-5R battery to empty, it would be destroyed in the process, so the radio does not allow it to get that low. Somewhere around 20% charged it shuts down.

Because the opposite is also a problem, charging the battery when full or nearly full, the charger will not charge a battery until it is in the semi-discharged (about 95% full) state.

There is a limited number of charge cycles the battery will go through, and this prevents people leaving the battery in a charger and having it die just from sitting there and being topped up.

I use a laptop as a desktop and have that problem. Since the laptop is smart enough not to start a recharge cycle until the battery is 95% charged instead of 100 (or close to it), it has lasted almost 3 years instead of 1.

Note that NiCad, and NiMH batteries will slowly drain away as you said,
but only at very low current. At high current they will go from "hot" to
"dead" almost instantly.

Bottom line is if the radio is down to one bar, recharge the battery.

Geoff.

Hi I have just had the Baofeng UV-5R for a few days and think its a very good radio for the price, I bought it with the usb programming lead and it was all working fine both sending data to and from the radio, but today I plugged the usb lead in and connected it to the radio and when i power on the radio it goes into transmit mode and it will stay in that mode until I unplug the usb lead then the radio will work as normal,I have also reset the radio but its still the same problem, has anyone had this problem or have I got a faulty lead.

I'm sure have already checked this but just in case,
what are your battery charger lights indicating?

Red/Green Flashing - Nothing in charger
Red - Charging
Green - Fully Charged

Hi everyone,
I am just getting started in HAM radio and just received my new Baofeng radio. I am utilizing Chirp to do my programming. After searching various internet spots for the Richmond, VA area I found a few repeaters near and also some clubs.
I plugged in the 2M freq's for W4RAT which is146.88MHz -600KHz offset CTCSS encoding/decoding at 74.4Hz. When I plug this information into Chirp and upload to the radio all I get is static and occasional a broadcast stating the call sign of the repeater . I thought I would at least hear some conversation, did I not put in all the needed information?

The 2 meter band has gotten very quiet over the years. 20-30 years ago it was almost always active if you were in a somewhat urban area. Today, not so much. If you're hearing the repeater ID then you're probably set up okay. If you can open the machine on transmit then it's just quiet.

If you are hearing the repeater call sign, you are on hearing the repeater. Sounds like you just don't have a very busy repeater. I always suggest not using Decode (Rx) tones since most (many) repeaters do not transmit tone. Rx tone is only needed if you are bothered by extraneous noise or other repeaters nearby on the same frequency- usually not a problem.

IMHO it pays to ask if the repeater outputs a PL tone, and if it does
use it. It will cut down on the radio making noise due to intermod, when
it thinks it has a signal and so on.

The nice thing about the UV-5R is that it can work split PL, where it
uses one tone on receive and a different tone on transmit. LMR radios
support it, ham ones usually don't.

Using the UV-5R just now and a voice said "low voltage" "low voltage" or similar. Popped into the charger and it continued. I thought the charger had enough power to operate the radio and charge the battery.

Just me?

The manual states that one should not charge the battery and run the UV-5R at the same time. I did it for a while until I read the real reason on Battery University.

Ok, had to go to that site and search.

I also wonder if the UV-5R charger is simply a 4 hour timer or does it actually measure the battery voltage? I know they say not to leave it on charge for a long time, ie >4 hours.

I believe that it monitors/measures the voltage. That is how it knows when to change light colors.

most 2 meter ham repeaters will have a carrier tail that sends a carrier for a couple seconds after someone transmits.
You can "kerchunk" the repeater, meaning you can key the radio for a second or two and see if you can hear the tail. If so, then you know you have everything programmed correctly, and you'll know if you are getting into the machine at least enough to key it up.
There will usually be a curtesy tone as well, usually a beep or combination of beep tones that lets you know when you have successfully transmitted through the repeater.
Try other repeaters in your area as well. Often programming all of the local machines then taking a listen during peak times of the day on each one will let you know where the action is. Also try 70CM UHF repeaters as sometimes there is more action there depending on your local groups prefered band.
Peak times are usually drive to work 7AM to 9AM and drive home 3PM to 6PM.
I have found that sometimes the repeater listed as the main club repeater isn't always the busiest repeater around.
It also makes good sence to throw your call sign out once in a while and just say you are monitoring. for instance, I would say "this is va6bkx monitoring" or "this is va6bkx monitoring on the w4rat repeater"
call out a few times a day and you'll eventually get someone.
If they realize you are a new ham, people will usually come back and help out with local repeater and net time information.

one further note, sometimes active repeaters are located in other towns or cities or counties close to where you live.
So, if there are any major suburbs, or other towns near richmond, then it might be a good idea to check out clubs and frequencies for those places as well.
It's funny, but more often than not the stronger more active repeater may be further away from your general area or even your own town or city.
Tower space is often at a premium in urban environments, so clubs will get tower space on a more distant, but perhaps higher better tower than one located right in richmond if that makes sence.
this may not be the case, but it doesn't hurt to explore the repeater land scape a bit.

You mentioned static and occasional ID. When the IDer comes in, does the radio quiet and the static go away? Can you get rid of the static noise by adjusting the squelch? Many times when not using PL or RX Tone if the repeater sends one, computers and other appliances create static noise. If the static is intermittent, could it be the repeater audio just weak at your location? Moving around your property should give spots of better reception if this is the case. I guess the bottom line is: Is your static on all the time or just when a signal is coming in? Is the IDer CW Code or voice? Is it clear and above the static or heard within the static?
Good Luck JIM

Hi everyone,
I am just getting started in HAM radio and just received my new Baofeng radio. I am utilizing Chirp to do my programming. After searching various internet spots for the Richmond, VA area I found a few repeaters near and also some clubs.
I plugged in the 2M freq's for W4RAT which is146.88MHz -600KHz offset CTCSS encoding/decoding at 74.4Hz. When I plug this information into Chirp and upload to the radio all I get is static and occasional a broadcast stating the call sign of the repeater . I thought I would at least hear some conversation, did I not put in all the needed information?

They may be transmitting on p25 digital radios or even encrypted p25. Look on Radioreference.com and verify that they are using FM as the UV5R won't do p25. In CHIRP also make sure to set the duplex to off so you don't xmit to them. They may be using a PL but just in case. Some agencies use splits too. If you monitor the dispatch frequency but just hear beeps as a response from dispatch, the mobiles are using a different channel to talk back to dispatch. You have to program both and dual watch to get both sides of the conversation.

On one win7 machine I installed the driver I finally just dropped the correct file into the \windows\system32\drivers folder to overwrite newer one win7 kept wanting to install. You can look up the driver version in the device manager to make sure that is not your problem or In that folder right click ser2pl.sys then properties and make sure it is version 2.0.2.1 under details. If not, just copy it in there from the driver package.

It helps being a computer programmer to trick the OS. :-)

> I'm having a terrible time installing the Prolific driver using the software supplied with the cable and also Prolific driver software I've downloaded from the net. I once had the driver show up in the device manager, but could not get it working the next day. Since then I've tried to install it on one desktop and three laptops all running WinXPpro/sp3/updated without success. The software seems to be installing correctly, but the Prolific driver does not show up in the device manager and the system does not see the cable when inserted.
>
> On the one time I did see the Prolific driver listed (@com3) on my wife's laptop, Neither CHIRP nor Baofeng software would talk to the radio. I've read the FAQ & files here @ Baofeng-UV-5R. Any advice or suggestions would be appreciated. Doug w7spy

Thanks for your input.

Charger lights OK and understood...

Again problems today. I fired the uv5r with the battery charged (solid green light on base charger). I checked in a local repeater this morning , and after four or five three minute QSO without problems, I was alerted that the exchange wasn't complete. The transceiver dropped in modulation. I had to quit. The batt level meter doesn't show zero energy neither low battery voice alerts were given, just three marks, like normal condition. Using low power (1 W) xmtr. Rig again on charger showing steady red.

I'm sure have already checked this but just in case,
what are your battery charger lights indicating?

Red/Green Flashing - Nothing in charger
Red - Charging
Green - Fully Charged

You could have moved an inch or so and that's all it takes an HT with a rubber ducky to get out of a sweet spot. Try a beam or a J-pole up in the air.

Or Echolink the unit (or another one that you can dedicate to the cause) and find some active nodes. I cobbled together an Echolink station from a 30 year old HT, old laptop, and used eBay interface. Fun to play with.

Thanks for the antenna advice, I just ordered 2 of those J0125A ebay antennas that were on sale for $3.56 each. There look like the best deal out there and they have good reviews for performance and fit without adding a rubber washer to fill the gap remaining when other antennas are used.

For a UV-5R, you wouldn't because it won't do 220.

Colin,
I certainly wasn't offended or insulted. It has been mentioned more than once in the past that this was an 'amateur and ham radio' group. It doesn't say that anywhere in the group owner provided description of the group. So I was merely trying to track down what would cause someone to think/say that. I've belonged to the group since March and I guess I've never notice the 'Group Information' area of the Home page before. I appreciate everyone that helped me pinpoint where this was at.

I've been out of the area so if this has already been resolved, sorry.

As far as I'v read, Windows XP included the correct driver for the Prolific chip and should work out of the box. I need to do this on my laptop so I will have some actual experience with it though.

If the cable is not showing up in device manager after it is inserted into a USB port, the PC is not detecting the USB-to-serial chip in the cable. This would make me suspect the cable as being bad.

These cables are cheap, and most likely poorly made. Check out "USB cable end.jpg" in the files area for an example. See if you can get your vendor to replace it. You may also want to buy another as a backup (that's what I did since they can be purchased for $6.60 or less).

These are cheap cables and aren't necessarily of the highest manufacturing quality. See "USB cable end.jpg" in the files area for an example. All it would take is a few strands getting together on the radio side of the circuit board getting together to cause the HT to go into transmit.

Have you tried it in another computer to see if you have the same problem?

If you order another you, consider ordering the RS232 one. Then you will
have one that will work on supported RS232/USB adapters and hopefully, you
won't have to battle the driver issue to try to get theirs working.

6882. Using the uv5r as a 2 way radio only

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-27 02:14:17 UTC
From: pt.lobos
Topic: 6882 Message: 6882

A friend of mine recommended the baufeng radios over the midland 1050 for hunting. I'm not looking to be a licensed ham radio operator, but i would like to buy a radio that has the best range possilble as a wlkie talkie type radio.My current cheap motorola talk about only go a mile or so at best. Im willing to study and pass the test and use repeaters and get the best range possible using the baufeng uv5r if that is the only way to get the best of these radios. I just want my radio to work out to 2 or 3 miles in a hunting environment (hills and trees)
Or am I better off just buying a pair if midlands and skip the programming and learning curve. Don't get me wrong I'm happy to learn and do my homework ,get the license if thats the only way to make the radio work better than a midland type radio.
Thanks for any help Mason

6883. Not all programming cables are equal

I recently had a very difficult time installing the programming cable on WinXPpro systems. Four XP computers would not recognize the cable at all. Turns out(thanks to Scott here), the cable was faulty. We bought three cables, so I opened another box and tried that cable. This cable was immediately recognized and the driver installed. It hadn't occurred to me that the new cable was at fault.

Great, now I'm programming the radios. But, about eight minutes with the radio connected and active, a pop-up window announces that the USB/Serial cable has malfunctioned. While removing the cable I, find the USB plug is very hot. Now I've got two faulty cables out of three. The third cable lasts 10 minutes in another computer before overheating and malfunctioning.

These cables cost $6.99 each on eBay @ NicheOne and came packaged in boxes marked 'Microphone'. I've written twice, but not yet heard back from the seller. I would recommend against buying budget UV-5R programming cables from this eBay shop.

Mason,

I think taking the Ham route is a good choice if you are interested in the hobby at all. It is fun, educational and someday may be useful to your fellow man.

That aside, if you want to use the UV-5R solely for hunting I think that good ole CB would better suit your needs as the 11m signal hugs the ground better than 2m or 70cm. I can tell you that hunting in the mountains and valleys will eat up just about any signal. If you find that there are repeaters in the area that you plan to hunt then perhaps the UV-5R would be useful.

Be aware that in some states it is not legal to use radios in the pursuit of game.

Let us know what you decide and how you make out on the hunt.

My 2 cents,

JL

As you found out UHF is UHF and you've determined the range you'll get with that. VHF will do better in the woods and there are 5 Part 95 channels you can use. The service is called Multi Use Radio Service (MURS). It is a 2 watts output service so program them all at low power.

o 151.82
o 151.88
o 151.94
o 154.57
o 154.60

The 151 channels are Narrowband so program them narrow. The last 2 are wide but you will find them in use everywhere. Called the Wal-Mart channels. I put both in A & B, turn TDR on, stuff the radio in my pocket and crank up the volume when I shop there. I like to give them echo or feedback. You get funny looks from the wally droids!

Ouch, that's quite a bad experience. I would suggest you open a Paypal dispute without delay. I have found some vendors delay until the deadline passes, and then completely ignore you knowing they're "safe". Same with the feedback window. In my opinion both time periods are too short.
On the other hand, the majority of vendors I've dealt with on eBay are responsive and eager to "make things right". Sorry you seem to have been unlucky.

Not sure about Kenwood but I needed a Wouxun cable so I obtained one and it works fine on the UV-5R 8-)

While we are on the subject of cables, I ordered a " cheapy " programming cable with my UV-5R from ebay and found that my computer (running XP) wouldn't " see " the adapter.

After trying the drivers and adapter on 3 computers running XP (and all 3 not seeing the adapter) I finally took the covers off the adapter to see if I could work out what was going on.

With the adapter plugged in to the USB port, I put my meter probes on the 2 outside pins (+ and - power) of the steel USB connector where it is soldered onto the circuit board and windows immediately gave me the " bing bong " sound of something being plugged into the USB port.

On closer inspection I found 3 of the 4 pins of the USB connector were soldered to the circuit board but the 4th pin wasn't, it was floating in mid air, hence no power to the board and windows not " seeing " the adapter and chipset.

I soldered the 4th pin back onto the board, put the covers back on and the adapter hasn't missed a beat since !

I'm not saying that this is the problem with all of the adapters we are using but it's another avenue to explore when Windows doesn't even " see " the adapter...

Just some more food for thought everyone 8-)

Cheers,

Rob.

You can also get one from Amazon but if you want the programing cable you must order it separately. I highly recommend getting the cable, it makes it much easier to program the radio.

From: Bill Smith
Topic: 6888 Message: 6888

Has anyone had trouble setting a repeater configuration in memory? Configuring and operating from the vfo setting works, but operating Menu 27 in VFO mode stores the configuration in memory with the offset set at 00.000. Any attempt to change the offset in memory mode from memory or vfo mode fails. Pressing Menu after setting the offset to 00.600 in memory mode returns the value to 00.000. Anyone else had this experience?

Thanks for that report Rob,

I suspect that this or someting similiar is the source of many of the problems with the cables. I am currently screwing around with what appears to be a cold solder joint in a battery eliminator. My unit comes on "Channel Mode" several times before it stays on for the day. This does not happen with a battery but the same thing happens with my other radio with THIS battery eliminator.

My experience with Chinese wire leads me to cold joints or impossible connections due to what I call "Black Wire". It might have been colored copper once but no longer will accept solder and is a dull black in color.

I see an opportunity here if one would build a good working USB cable. Just use real wire and solder correctly please. The price is not so much a concern as the quality of the unit. I cringe when the one fellow had 3 cables and all of them went bad? $21 in cables and none work. Makes the radio look bad and it is only shoddy workmanship and /or materials used on/as an accessory.

JL

Subject: RE: [baofeng_uv5r] Re: Where to get one

Not sure about Kenwood but I needed a Wouxun cable so I obtained
one and it works fine on the UV-5R 8-)

While we are on the subject of cables, I ordered a “
cheapy “ programming cable with my UV-5R from ebay and found that my
computer (running XP) wouldn’t “ see “ the adapter.
After trying the drivers and adapter on 3 computers running XP (
and all 3 not seeing the adapter) I finally took the covers off the adapter to
see if I could work out what was going on.
With the adapter plugged in to the USB port, I put my meter probes
on the 2 outside pins (+ and - power) of the steel USB connector where it is
soldered onto the circuit board and windows immediately gave me the “ bing
bong “ sound of something being plugged into the USB port.
On closer inspection I found 3 of the 4 pins of the USB
connector were soldered to the circuit board but the 4th pin wasn’t,

it was floating in mid air, hence no power to the board and windows not “
seeing “ the adapter and chipset.
I soldered the 4th pin back onto the board, put the
covers back on and the adapter hasn’t missed a beat since !
I’m not saying that this is the problem with all of the
adapters we are using but it’s another avenue to explore when Windows
doesn’t even “ see “ the adapter…..
Just some more food for thought everyone 8-)
Cheers,
Rob.

Having had my own experiences, and reading this list for a couple of weeks, I would recommend:

Buy the radio and programming cable from Amazon ($54.50 and $18). Get several folks to go together on the cable or buy one and rent it out for $2 per week. Use CHIRP software. Problems over....

I only paid $48 for my radio with cable, but endured a lot more that $10 in frustration getting everything to come together.

There is probably a low-cost source of the Amazon cable for a lot less, but darned if I know which of the Chinese vendors has the good cables (if any do)? If someone has a Amazon SainStore cable and can read from the cable and or packaging anything about who makes it or just what version it is, that would be great!

I got my programming cable on ebay from www.radiogearpro.com
It just worked on my laptop running XP Pro. I had preloaded
drivers from FTDI and Keyspan and one of them must have worked.

If that friend drove to your area, and was a few miles from your home, you may wish to talk with him on simplex to give him directions to your home, which you might not want to share with all of the folks on the repeater.

I was trying to give an example of the usage of the "reverse" function as I know it. Now Alek knows a little more than he did before.

are those the color coded open use freqs? or are those color coded ones UHF freqs? We hear american truckers using a few of those MURS frequencies up here once in a while, but they are certainly not open use freqs here.
not to mention the 25 to 50 watts the truckers are using on their commercial LMR radios.
we've got our own VHF CB like open frequencies here for truck to truck comms...called LAD channels. I call them Lid channels hi.

Subject: Re: [baofeng_uv5r] Using the uv5r as a 2 way radio only

As you found out UHF is UHF and you've determined the range you'll get with that.
VHF will do better in the woods and there are 5 Part 95 channels you can use.
The service is called Multi Use Radio Service (MURS). It is a 2 watts output
service so program them all at low power.

o 151.82
o 151.88
o 151.94
o 154.57
o 154.60

The 151 channels are Narrowband so program them narrow. The last 2
are wide but you will find them in use everywhere. Called the Wal-Mart
channels. I put both in A & B, turn TDR on, stuff the radio in my pocket
and crank up the volume when I shop there. I like to give them echo or
feedback. You get funny looks from the wally droids!

Ditto, same cable, same vendor. Worked at first then stopped. Didn't check to see if it was hot. Now, the red Tx LED comes on for a minute then flashes nine times and the display comes on. No connection with the computer though. Base of rubber duck gets warm.

They (Nicheone - name of Ivan) did reply in about four working days and the replacement should be here this week but reading your post, it'll be the same. They said no one else had complained. Didn't have to send the faulty one back. No charge.

At least it didn't break the UV-5R.

You don's say where in the world you are located so I am going to assume that you are in the USA and under the jurisdiction of the FCC.

My recommendation is the pair of Midland GTX 1050 walkie talkies.

I have a pair of Midland GTX 400 FRS/GMRS walkie talkies. Top-of-the-line at the time I purchased them.

Don't believe the manufacturer's distance claims. They probably aren't obtainable under perfect conditions. Your conditions certainly won't be perfect. Therefor, don't expect a big difference over the Motorola Talkabouts.

Channels 8-14 are license-free FRS only channels and are therefor limited to 1/2 watt power. The remaining 43 channels are FRS/GMRS shared or GMRS only and allow you to select the higher power settings (but their use requires a FCC license in the USA).

I assume you were talking about getting a ham license to use the UV-5R. Your hunting buddy would need a ham license as well.

The UV-5R probably isn't a good choice for hunting. It isn't always quiet when you want it to be (poor selectivity). You currently can't disable the alarm button.

Antennas have nothing to do with receiver sensitivity, it is a figure that exists as measured by what the receiver can receive, not what happens when you attach the antenna.

Unfortunately paying more for a cable doesn't guarantee it is not a 'budget' cable.

I use my $8 cable from 409shop all the time with no issues. I've tested my $6.60 cable from DealExtreme and it works fine.

Hi JH,

I have compared the two radios on VHF 145.000 to 146.00 MHz
Full power on both batteries.
I use a stationary roof antenna X-300
When receiving a week station which I can clearly read on the UV-3R+ it opens the squelch on UV-5R but you can't read the words being said.
Maybe the UV-5R is not tuned optimal?

I have one of the Amazon Sain Store cables.
The only text on it is: LH

It doesn't have any problems connecting with the UV-5R--no force fit needed.
The USB end is molded so there's no way to open it.

Hi Leif

While your test is fair, it isn't totally accurate. It may depend on how the noise rectifier works on the squelch. It might also be a selectivity issue.

Short story, at least for you, is that 1 hears better than the other. The question is by how much I would guess.

The only reliable way to test them is on a service monitor like an IFR1200, etc. Then we would be able to determine which has better SNR, etc. and by how many dB.

There might only be a 3 or 4 db difference based on what you are saying. That would only be about 1/2 an S unit.

It's quiet if using a molded earpiece and seperate mic, like Secret Service uses. Can be used Vox too. The easiest hands free operation. Although, vox might be a bad idea if firing a gun.

Ran a few lab measurements on a UV-5R s/n 20120R33615 (409shop.com)
Power on 3 reads BFB251, Power on 6 reads 1204171 VER-05.

Xmit 146.52 actual 146.51989 (110 Hz low)
Xmit 446.00 actual 445.99995 (50 Hz low)

Tested better than a Yaesu VX-8R ($400)

Used a HP 5328A with Op10 (TCXO i.e. crystal in oven) and Op31 1.3GHz range.

Second test was Battery Fuel Gauge.

3 bars 7.35 Vdc
2 bars 6.95 Vdc
1 bar 6.53 Vdc

Lab DC Power Supply and Fluke 89 IV DVM

I'm happy to report that a recent post by Rob suggested a troubleshooting route for me. He disassembled a faulty cable and repaired it. I disassembled the cable that never worked and found a cold solder joint where the cable attaches to the PC board. It's now working and I'm programming our UV-5R's w/o waiting for another cable from China.

Also, my eBay seller NicheOne has responded very nicely and refunded my money for three cables. They say they've had no other problems with these cables and will contact the manufacturer. I've now opened all three cables; the other two that overheated and failed reveal no visible problems. Probably the IC is cooked. The cables contain PC boards that appear adequately built, but the solder work attaching them to the cables is terrible.

I really appreciate this forum for the help I've received directly and what I've learned just reading the mail.

About the same around here. We have lots of local repeaters but very few of them in use. I guess 3/4's of them sit quiet most of the time. I remember a time here in western NC when you had to stand in line to get to chat. Not much like that anymore. Most of the ham folks around here have moved to HF. I have to admit I use HF more that 2/70cm. Now that I'm running an echolink node I'm starting to use 2m more, that is way I bought the Baofeng..

I got mine to scan all the freqs by hitting MENU, using the arrows, found scan and entered SCAN ALL an then closed by hitting EXIT. What I cannot seem to get is the dual bands scanning! Mine sits on whatever freqs I arrow to.

In a message dated 8/24/2012 11:59:20 A.M. Central Daylight Time, thestripe@... writes:

(http://groups.yahoo.com/group/baofeng_uv5r/post) Hi, anyone else having this problem? I saw the thread from "uofa197"

His solution was -

Programmed by keypad...just changed my MDF-A & B to frequency from name and it now works...
don't know how the "name" got set in there...must have been the "reset all" I did in the beginning that took me to chinese voice!!Q!!

- I have the same setup, programed by keypad. His solution does not work for me. I have 7 frequencies stored only the first 5 are scanning. Very odd. No stopping just looping 1-5 skip 6 and 7 entirely. Any ideas?

Thanks,
Rob

6918. Help! Pop up window (Port, Vendor, Model) does not appear.

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-28 04:09:17 UTC
From: woodfiel
Topic: 6918 Message: 6918

I have two UV5R radios (one for my wife). My friend has 2 and is buying 10 more for hams in the area. We are trying to get Chirp ready to upload all of frequencies to the new radios.

I have it working on my PC (Lenovo w520, windows 7). I have the right driver installed and a recent build (July 30, 2012). It works great on my machine (though it took me a few hours to understand the problems and get it working).

On his computer, when we click download or upload, the radio popup window does NOT appear (the one where you set the port, vendor, and model).

As far as I can tell his set up is exactly like mine. I have double checked the following on his HP laptop (I don't know the model)
running windows 7.

1. He has the right driver installed and assigned and it is used for the programming cable.
2. He has the July 30 build from danplanet. We also tried the more recent build but there was no difference.
3. Chirp runs and we open and save files and manipulate the memories in chirp without a problem.
4. We have tried his cable on my machine and it works. My cable also works on my machine but his machine doesn't pop up a window no matter which cable we use.
5. We tried my radio on his machine and his radios on my machine. My machine works, no popup window on his machine, no matter what radio
use.
6. We've rebooted several times, rechecking the drivers each time.
7. The machine says the drivers are working.
8. The only difference is my com port is port 5 and his is port 8. I don't believe that would make a difference.
9. We tried a different port (port 7) but it didn't help.

I know we can change the com port number in te popup window to any number by typing it in, but you have to get to the popup window first.

Help!

Any suggestions would be appreciated.

Thanks in advance.

Scott Woodfield

Did you use the installer or the stand-alone version of CHIRP?

The installer version is preferred if I remember correctly. If you somehow mixed in the stand-alone version, perhaps that's causing some confusion.

It's good to know you got one to work and a refund for the others.

Just curious, which end of the cable did you open and how? The USB end looks like solid hard plastic.

I've been noticing with interest all the issues with usb cables/chips.
Maybe i've been lucky as i have not had any problems with supplied usb cables, but just for those who do have issues, i also use an FTDI usb to serial adaptor, these units work with everything, and are the product to use if your system is win7, though they work just as well with xp etc.
Maybe you'll pay a bit more for FTDI but to me its worth it for less hassle.
Just my two pennies worth.

What is the menu number for SCAN? What is your firmware version (press and hold the 3 key while turning on the HT)?

You can scan the top display or you can scan the bottom display. You can't scan both displays at the same time. There is no need since each display scans the same 128 memory channels.

Roger, I agree with you 100%. I have had NO problems with the FDTI adapter. It juat works. I did have a lot of problems with the Prolific chip. I got it working before this group started, but it was a chore to learn all of the little tricks to make it work by my self. I don't need another one, but if I did I would get the FDTI chipset every time.

> At the weekly ham breakfast this morning, various of the BaoFeng and Wouxon programming parameters. Clearly, folks with lots of expertise and newbies alike are in the dark on many of the 40 BaoFeng settings. What do they do? Why should we set them and how? Many of the questions arising on websites seem to be from folks who haven'r read the manual, but the rice paper quality may be the cause of that. Even some of the (now many) YouTube videos were shot from the hip and show what to do but not why, occasionally with keystroke errors intervening. (One excellent intro video actually was done from a script. What forethought for the rest of us.)

6940. standard earphone adapter

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-28 16:16:59 UTC
From: unalias2
Topic: 6940 Message: 6940

I want to use my standard (comfortable) earphones when monitoring, and I see the speaker out jack is wired a bit different on this radio. I created a short adapter using a 3 conductor 2.5mm male plug to a 3.5mm monaural inline jack by connecting the barrel and the center connection on the 2.5mm (the tip connector of the 2.5mm is not used for speaker out; beware the diagram in the photos section is incorrect). this cost less than $2 to build and now I don't have to use the one that came with the radio, which I don't like.

Hi..

I've had zero problems with my cable, but just checked the usb end. It looked to be molded, but close examination showed there was a "line" between the top and bottom covers. The actual usb plug will move slightly back and forth, so no molding.

It did have a small sticker on the usb end that went over the line between the top and bottom cover. Looks like an anti-tamper/QC/Mfg mark type shaped like a bulls-eye and dated 2012-6 in on of the rings. Looks like it might have been inspected and tested after manufacture.

mike, sorry if this is a double post, the interface seems a bit quirky this morning.
the link you posted shows the tip and barrel used for speaker, and so does the photo in the photos section. My post was made because I found my UV5R is not wired this way. I dissected my baofeng speaker mike and traced out the speaker lines to use the middle connector and the barrel (sleeve) of the 2.5mm connector (and had no connection to the tip on the 2.5mm. Since the tip connection may be used for something other than speaker it might have a potential on it that may harm the audio circuit, so I avoided it since it was not used in my speaker/mic either. My post was only to point out this wiring difference just in case.

6946. New Menu Database

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-28 18:39:29 UTC
From: jleahy00
Topic: 6946 Message: 6946

Hi all,

I have started a database of the 41 Menu items of the UV-5R. Your help would be appreciated particually in the Function/Purpose and User Comments sections.

Simply use the Edit function to the right of the menu item entry, make your changes and then SAVE your entry.

Since there are some units with different entries there is a "Settings Newer" column. If your unit has anything different from the column "Original Settings" please enter them here.

Hope that this helps.

John

If you bought a TV or any other house hold item, most of us would not struggle with it's malfunction but,seek a remedy and ether return the item or get it fixed. The problem with cables is bulls---, so why have I and so many other good people fought with this cable issue? So I lost time and a very little money in the garbage cable, but know one knows where to buy the exact proper cable. Just speaking for myself, it's just not worth the hassle, I want to just spend my money on something and have it work right off the bat, but is there any thing wrong with that thinking? Please Please Please, if some knows where to buy the exact right device please advice and I will buy it, done.

Aint that the truth. I bought a chineez cable off ebay for $7 running win xp_sp3 pluged it in and it works great. Now the programs are a little tempermental, d/l ing to the radio was a headache at first then I found out if it doesn't d/l the first time it ALWAYS d/l ed the second time. CHIRP appears to be the best I use several ver. switching back and forth... Now the Baofeng software isn't worth the time it takes to d/l it. After 3 weeks it still hasen't worked for me. This cable issue looks like a hit or miss. Good luck on your hunt.

Frank,

I understand your frustration. I've had many years working as a liason between a manufaturer and the general public as a Radio Shack store owner. I can assure you that this is not the only device with a problem.

As luck would have it for me I purchased both of my units from Radioshop888.com. The cable (available seperately $9.80) was molded on both ends and has their website embossed on the USB end. I am hoping that because it was molded there is a good chance that it wont suffer from a loose/cold solder joint. The cold solder joint and or poor wire has been a notorious problem with Chinese stuff.

All that aside many of the folks on this group just plain "eat up" these problems and enjoy helping if/when they can.

Good luck,

JL

Usually the ones that gripe the loudest and refer to the product as "junk" or use other words I will not post are the ones who don't read the manual.

I use the OEM software, I will migrate to CHIRP someday when I have a few moments. I had one software glitch with windows 7. My XP maxhine worked the first time. I own 2 of these radios and I like them. I had one struggle with manual programming when I did not realize you have to delete a channel before you can write to the number.

One of my instructors used to say "RTFM". Translated: Read The Freaking Manual".

So then, do you believe it more of a counterfeit chip issue or cold solder?. By the way, I fought for two weeks back in May with the cable nightmare, what a hassle. Now everything's fine, but in hindsight I kept telling myself, Frank you bought this crap, it should work, why am I spending hours on a 11 buck cable? Finally I beat the cable. But know no one should have to work with such garbage as is this cable, no one.>>>>KJ6KHF Beaumont Calif.

I think you misunderstand the psychology of many of us.

We bought this radio because it is cheap. (Or perhaps we bought this radio because we are cheap. I forget which...)

Anyway, we kind of expected to have issues because of the price and where it came from. Deep down many of us didn't expect it to work at all.

Does it have issues? Yes it does. However, many of us like trouble-shooting and fixing things. We also like to hack and modify things. It's how we learn. For $50, this radio has provided many of us with significant play and educational value. What may seem like work and aggravation to you is an enjoyable challenge to us.

If we really wanted something that works out-of-the-box, there are many other options available if you're willing to pay for them, but what's the fun in that?

This also extends to the cable and its problems. It's all part of the game.

This radio obviously isn't for everyone, and there's nothing wrong with that. You just need to buy a more polished solution.

George

Then you should go buy a Yaesu, Kenwood, or icom from a reputable amateur radio store (Ham Radio Outlet (HRO) comes to mind), online or otherwise. If you wanted "right off the bat" reliability why are you messing with cheap, $50 Chinese radios?

Just sayin...

How do you find this adapter? Is it available on E-Bay and what is it called?

If you use the WXUSB cable sold for the WOUXON KG-UV3 from Powerwerx and sold via HRO and others it works perfect every time.

Hi all,

I have started a database of the 41 Menu items of the UV-5R. Your help would be appreciated particually in the Function/Purpose and User Comments sections.

Simply use the Edit function to the right of the menu item entry, make your changes and then SAVE your entry.

Since there are some units with different entries there is a "Settings Newer" column. If your unit has anything different from the column "Original Settings" please enter them here.

Hope that this helps.

John

The UV5R is not the first low cost electronic device I've used. I've been a SWL for years and one of the latest exciting niches in radio listening of distant stations has been the Ultralight category of receivers. I've also been owner of a Degen 1103DE SW, a portable with good specs, all under the USD 100 category.

The main issue with these small Chinese is the Quality Control. It's certainly very variable. Also much of the electronics nowadays are brands, many of the well-known, but manufactured, assembled, adjusted in Chinese factories, and certainly with electronic components made in China. And also Chinese born brands.

In these days, the so called programmed obsolescence is a new concept we are experiencing.

A modern concept of business has come around since electronic commerce has evolved: the eBay stores, with reliable and unreliable vendors.

So we should take into consideration that we subject of new challenges as users and consumers.

Regarding the uv5r and its accesories, as in other Chinese brand sets, I am astonished as how a such low cost has been obtained, despite its decent characterstics. We are getting an excellent cost/benefit ratio with this little piece. But risks are higher than we had with traditional brands.

That's why I decided to pay double for the unit, in a local ham store, considering the possibility of a 1 year warranty and eventual person to person negotiation.

The uv5r opens a new possibility to new hams, specially after the advent of Internet and cell phones as revolutionary means of communication.

I think you misunderstand the psychology of many of us.

We bought this radio because it is cheap. (Or perhaps we bought this radio because we are cheap. I forget which...)

Anyway, we kind of expected to have issues because of the price and where it came from. Deep down many of us didn't expect it to work at all.

Does it have issues? Yes it does. However, many of us like trouble-shooting and fixing things. We also like to hack and modify things. It's how we learn. For $50, this radio has provided many of us with significant play and educational value. What may seem like work and aggravation to you is an enjoyable challenge to us.

If we really wanted something that works out-of-the-box, there are many other options available if you're willing to pay for them, but what's the fun in that?

This also extends to the cable and its problems. It's all part of the game.

This radio obviously isn't for everyone, and there's nothing wrong with that. You just need to buy a more polished solution.

George

Purchase one of these http://tinyurl.com/dgvb6u
And one of these http://tinyurl.com/9ymmg7s
Hook it up, install drivers if windows doesn't do it for you and it will work every time for you.

Frank,
This has been discussed by the group more than once. There is no need to repeat it here. Search the group using "FTDI" or "Genuine Prolific" as the search terms and you should find discussion about and links to the suggested hardware.

Subject: [baofeng_uv5r] New Menu Database

Hi all,

I have started a database of the 41 Menu items of the UV-5R. Your help would be appreciated particually in the Function/Purpose and User Comments sections.

Simply use the Edit function to the right of the menu item entry, make your changes and then SAVE your entry.

Since there are some units with different entries there is a "Settings Newer" column. If your unit has anything different from the column "Original Settings" please enter them here.

Hope that this helps.

My $6.60 programming cable that I bought from DealExtreme also has "LH" molded into the USB end of the cable. It is my spare and it came in a small cardboard box with a triangle shaped logo with "LiHUi" imprinted under it.

The $8 cable that I use all the time came from 409shop via eBay. I received it in April and has worked from the very first time I tried it. It has "MEGAVOLT" molded into it.

6979. Menu Function Database

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-29 01:30:44 UTC
From: jleahy00
Topic: 6979 Message: 6979

A big THANKS to whoever finished this project for me, I was surprised when I got to the next page and it was done..... what a Group!

We now have for quick reference the 41 Menu options defined so that hopefully the manual will make more sense to new folks and clear up some other questions.

This is a work in progress and can be edited by any Group Member as needed. If you think that we could benefit by an additional column or two let me know.

You can find this latest UV-5R Group effort under the Database link on the left side of the Group Home Page. There are several ways to print and download the results if you wish.

If you should notice any spelling errors or misinformation PLEASE either fix it or let me know and I'll fix it.

Good radio, GREAT Group of folks !

John

I believe Frank wants the programming cable to work 'right off the bat'. A defective cable and/or non-working device driver is radio independent.

I just can't agree. my UV-5R arrived yesterday. Sure the UI lacks polish and organization, and it isn't waterproof but then again our expensive $$$$ police radios from that US company weren't either (my experience, 1996-2001). None of this is an issue for me because this little radio is great value and it does in fact work and well. (my other radio is an Elecraft by the way so I am not afraid of expensive, I just choose to shop for value, not price)

I bought my UV-5R from a major US ham retailer so I could at least get a return policy and maybe a little support. I then paid $19.95 for the cable from them knowing the issues and wanting to avoid them. I can buy Yaesu or Kenwood programming cables from their dealers at $30-35. I should be able to buy a quality cable for this radio too if I choose to. Mine is getting returned.

I sincerely believe that if the makers of the UV-5R made this cable themselves, it would be as solid as their radio. It is clear and obvious that there is a shift in Chinese quality. Some companies clearly have it. Others clearly don't.

...still looking for a good cable, at any price, for my high value HT...

-Chris.

6983. Boafeng UV-5R Antenna

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

I was wondering why I couldn't hit repeater 15 miles away with 3 Baofeng UV-5R. But I can with my Yaesu, and Wouxun HT's. So I checked the antenna with my antenna analyzer. And I found that the SWR on 2 meters are way off on all 3 lowest was 1:8 on 144.100 on 1 antenna. Other 2 lowest is 3.2 on 2 meters. But the 70cm side it's perfect. I did try a cheap (J0125A Female universal Antenna) that I got on Ebay for about $4 it read perfectly. And works! Now I can open the repeaters with the Baofeng. I just wanted to info everyone not to trust the factory Baofeng antenna.

Those little $4 antennas on eBay are the best deal since,... well, since the Baofeng UV-5R!

I ordered 2 and I'm still waiting for them to arrive. They seem to be taking a tour of the US. It must be their first visit.

From: Jim
Topic: 2040 Message: 6986

S-CODE [menu 17], used when programming a channel to select from one of the fifteen 5-digit ID codes that have been assigned to the UV-5R via the Baofeng software (Edit|DTMF|DTMF Encode).

PTT-ID [menu 19], used when programming a channel to enable sending the DTMF ID code selected by S-CODE. The selections are OFF (no ID is transmitted), BOT (ID sent at begging of transmission), EOT (ID sent at end of transmission) or BOTH (ID sent at BOT and EOT).

I hope that helps,
Jim KC9HI

Israel,
For most, the UV-5R OEM antenna is a good as good as they come and very little is gained by switching to a 3rd party antenna. In your case it appears that you are one if the very few that got a dud.

My programming cables for the UV-3R and UV-5R have Radioshop888 molded on the bottom side of the USB plug.

When received I plugged them into my laptop with Windows 7 Home Premium (64-bit) operating system. Windows found drivers and loaded them.

The cables work perfectly.

Sigh..... (this is getting old)

My cable came from radiogearpro. I plugged it in my laptop running XP and it just worked. Previously, I had installed drivers for my RadioShack scanner cable (FTDI chipset) and for a Keyspan USB to serial adapter. YMWV.

yep, just got one today as well.
turns the uv5r into a very commercial looking nice feeling radio...not that it's bad with the regular battery, but that extra little bit of height and weight seem to make it more professional looking maybe...
Mine won't clip in though...it gets nearly there, but does not secure into the clip on the top of the radio...anyone else had this issue?
my stock 1800MA battery clips in just fine, and 5 other people who got the 3600MA battery today didn't have trouble clipping their larger batteries in...
It almost looks like the plastic casing on the 3600MA battery is just a hair too high on the front where it meets the bottom of the radio case.
I didn't try another battery to see if it clipped in, I should have. Will try that next to see if it is the radio case or the battery case that is the issue.

mine nearly clips in, so it's not going to be falling off, and actually
takes quite a tug to get it to come off, but it does come off without
pressing the release tab on the top...so it's not a big deal since it's more
or less secure, but I just want it to clip in to be 100 per cent sure of
it.
mine came fully charged as well.

regards

Curious if you have the belt clip installed. If you do and haven't taken
that off I would see if that helps. I recall my 3600 goes in funny and it
had something to do with either the belt clip, or the guide rail portion.

I do have the belt clip installed. Will try removing it and see if the battery clips in...of course, it's going to be an issue if the belt clip is preventing it from clipping all the way in since I'll want to use both batteries etc...will check though thanks for the suggestion.

regards
Colin

I was wondering why I couldn't hit repeater 15 miles away with 3 Baofeng UV-5R. But I can with my Yaesu, and Wouxun HT's. So I checked the antenna with my antenna analyzer. And I found that the SWR on 2 meters are way off on all 3 lowest was 1:8 on 144.100 on 1 antenna. Other 2 lowest is 3.2 on 2 meters. But the 70cm side it's perfect. I did try a cheap (J0125A Female universal Antenna) that I got on Ebay for about $4 it read perfectly. And works! Now I can open the repeaters with the Baofeng. I just wanted to info everyone not to trust the factory Baofeng antenna.

Well, I have to disagree. I bought the $3.79 antenna and it outpreforms the OEM on both VHF and VHF. The OEM works but not near as good as the $3.79 one. I just received three more for some ham friends.

Yes, bad luck. I have two of the Baofeng antennas, one came with a UV3R+, and they were both spot-on.

I have the same cable for the uv 5r, no logo on it, and it works perfect.

I ordered mine with the radio order, cost about $4 extra w/ radio.

When my radio came it was also declared as a toy, which it is.

Cheers, Ian

MIne takes several tries to clip in with no obvious indication that it has latched. I have to push, then pull to see if it latched, and repeat until it latches.

I haven't done it often enough to see if it gets easier with wear.

I also noticed this issue, but the 3600mah battery seems to stay on
fine, even though I can pull it straight off without depressing the tab.
I've even dropped it a few times, and it still stays on.

yes, this is exactly what is going on.
it's firmly stuck on there...but in looking at where the battery case meets the radio case, there are small, perhaps 1/32 inch gaps on the sides and top but it's tight across the front...leading me to believe that if one were to gently file that front edge of the battery case it would probably slide right in.
Easy enough to do as well since that part of the battery case has a pretty significant edge sticking up that could be easily filed down a bit.

regards
Colin

Yes, no problems whatsoever. I plugged them in and let Windows find drivers.

BTW, for all the people complaining of cables and drivers, it is not just programming cables. Model railroaders that use USB interfaces with "DCC" (Digital Command Control) systems also have problems. Or rather, some do, some don't.

For these cables, "Radioshop888" is molded into the underside of the USB plug.

Speaking of the UV-5R and the 3600 mah batteries (with Nagoya NA-701 antennas)... I am down on the Louisiana Gulf Coast and currently experiencing the effects of Hurricane Isaac. I helped man the club station yesterday afternoon and into the evening. I left one of my two UV-5Rs at the club station as a backup in case they lost power or an antenna. The HT could still easily hit our repeater just a few blocks away.

Sometime last night power was lost in that area of town and this morning fellow club member Rudy was handling traffic with the UV-5R. I have the 3600 mah batteries on both of the UV-5Rs, as well as one 1800 mah battery.

My home is about 4 miles away from the repeater, and sitting here at my desk and computer I could talk through the repeater with full quieting.

I topped off the 1800 mah and 3600 mah batteries I had here at home, and just returned from swapping out batteries with the radio at the club station. I left a charger up there, got the generator started (since I was wet anyway), and we have things back up and running now.

But it was nice that the little UV-5Rs performed well, good, clear signal, and the battery charge with the 3600 mah batteries really holding up. I don't know how much longer they would have gone, but for about five hours they got a real workout.

We have it hooked up now with a SMA-F to BNC adapter to one of the rooftop antennas. However the NA-701s worked well for us both from inside the radio room, for me from inside my home, and while mobile, in my vehicle.

I feel like I've certainly gotten way more than my money's worth from these radios just today.

If my uv-5r is in dual mode and I am listening to the FM radio, will it mute if either A or B channel goes active, or just the one with the arrow side of it. Mine will only mute if the arrow is side one of the channels. I would love to be able to monitor both channels while listening to the FM radio, is this possible?

Thanks

Rodney

I ordered one of these AAA battery cases for the UV-5R and they arrived today. The fit isn't perfect but after several attempts I got it to snap in at top and bottom.

At first, it wanted to snap in at the top but kick-out at the bottom. With a little practice and extra force, I can mount it consistently. I'll buy another so I have one in each car.

7024. Freq Unlocker

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-29 22:01:18 UTC
From: kev_barefoot
Topic: 7024 Message: 7024

Hi there,
Im new to the group and so far like what i see :O)
Ive just received my UV-5R and so far so good, im having alot of fun learning its capabilities. As I have not applied for my Ham Licence yet Im not using it as a transciever and would like to know how the unlocker enables the HT to rx 100-999 mhz? I've managed to successfully patch the HT to the extended 2 mtr and 70cm frequencies but wondered how you input the freq 100-999? Where do you put these numbers? There is obviously 2 band 'areas' in which you input the extended frequencies, which one do you put the 100-999 mhz?
Also, there are two tick-boxes which can disable the TX but these seem to be greyed out?? I cant untick them unyet feel it is necessary to disable the TX for safety reasons. I dont want to be catching the PTT and causing a problem with my HT....
Can any one advise me please. Personally I love this HT and have had NO issues whatsoever with it! The cable works fine, it charges well, is a great size, sounds brill etc etc. Up to now I really cant fault it. Now to register for my foundation licence and get some experience at our local Ham club.... :O) I've not attended just yet as ive been busy so relying on you peeps to help me with this little issue ive come across.
Kind regards
Kev Barefoot

Hi John,
Thanks for the reply.
I maybe didnt explain myself well enough. I actually found the ‘extended’ frequency unlocker on this yahoo group within the ‘files’ section and after having a look through the site and pages you sent I cant find the information I need that I described in my first post. Thanks for the links anyway, i’ve stored them as Favourites for ease of use

Kev,
I've never used the 'hacked' VIP software myself so I can't give you advice based on hands-on experience, but I might be able to give you a little help.

Take a look at the accompanying text that shows you a list of verified frequencies. See how the list is split into two ranges? We'll call the first range VHF and second range UHF to correspond to the UV-5R's bands.

The verified VHF range goes from 140-181 MHz and the verified UHF range goes from 380-520 MHz. Put 136 and 220 in the From and To settings for VHF0 on the VIP Other page. Then put 380 and 520 in the From and To settings for UHF0 on the same page. The Allow transmit tick boxes are ticked and greyed out on the unhacked VIP software so don't worry about them. Connect the UV-5R up to the computer and write the changes.

With the UV-5R disconnected from the computer, manually program a VHF channel with a receive frequency between 174 and 181 MHz to see if it even works. If it does, program a transmit frequency of 220.000 MHz into the same channel. Since we know that the UV-5R won't transmit in the 220 MHz band, that should work as your TX inhibit.

Program a UHF receive frequency like you normally would, except switch to the VHF band and program 220.000 MHz for the transmit frequency as well. So basically for every channel that you program, you will program 220.000 MHz at the TX frequency.

Remember... I have not tried this so this is all a big SWAG on my part. Let us know if this does or doesn't work. If it does, you will just have to experiment where you upper VHF limit and lower UHF limit should be on VHF0 and UHF0. If you figure that out, let us know that too.

Good luck,
Jim KC9HI

Colin, can you say more about the ebay offering,
like maybe the ebay item number so I can see the
whole listing? Thanks. Dave NE5EE

There are several. Search for "female universal kenwood". Or look at item 170735397155 for an example.Ian

I have a major announcement here...

Due to the power outage at the club station from Hurricane Isaac, we actually made use of the UV-5R's LED flashlight function several times.

I had previously thought this feature was totally useless. It is not.

It is actually the alarm/siren that is totally useless.

That is all. You may return to your previous discussions.

The only way to work this correctly is to throw this chinese crap into the waste can before expending yet another handful of dollars for a temporary momentary fix. Donn, KA0SOH

In a message dated 8/28/2012 3:44:29 P.M. Central Daylight Time, jleahy00@... writes:

Frank,

I understand your frustration. I've had many years working as a liason between a manufaturer and the general public as a Radio Shack store owner. I can assure you that this is not the only device with a problem.

As luck would have it for me I purchased both of my units from Radioshop888.com. The cable (available seperately $9.80) was molded on both ends and has their website embossed on the USB end. I am hoping that because it was molded there is a good chance that it wont suffer from a loose/cold solder joint. The cold solder joint and or poor wire has been a notorious problem with Chinese stuff.

All that aside many of the folks on this group just plain "eat up" these problems and enjoy helping if/when they can.

Good luck,

JL

Sub ject: [baofeng_uv5r] There are people in the group much better educated then I, but why the struggle?

If you bought a TV or any other house hold item, most of us would not struggle with it's malfunction but,seek a remedy and ether return the item or get it fixed. The problem with cables is bulls---, so why have I and so many other good people fought with this cable issue? So I lost time and a very little money in the garbage cable, but know one knows where to buy the exact proper cable. Just speaking for myself, it's just not worth the hassle, I want to just spend my money on something and have it work right off the

bat, but is there any thing wrong with that thinking? Please Please Please, if some knows where to buy the exact right device please advice and I will buy it, done.

Hi Jim,

Thanks for your reply mate.
Right....I've pretty much understood what you've said there but its not quite what i'm asking, if that makes sense....
Basicly what i'm looking for is to turn my HT into a receiver with the freq 100-999 Mhz available but WITHOUT the risk of catching the PTT Button and causing an output chip to blow.
If I read this correct http://f1.grp.yahoofs.com/v1/ELs-UGlNAJx_849VpkubERiNl73hEZ9Zyu1YHU0eP5R1HYfj7vFZguRIWCZOiFXU_-Vz-nXzJ9uEiCN59LEl2WzN0Qh0MZs9CMbXGtUh7MNd3DETsujv2W5L/UV-5R%20Freqency%20Unlocker/Instructions I cant see any reason why I cant do it, Im just unsure as to how and where to put place the freq range i.e. 100-999 mhz. I've had a little time to sit and ponder the issue and i'm wondering if i'm meant to put in the vhf boxes 100 up to 300 then in the uhf boxes, 300 up to 999?? That seems feasible to me but it still leaves the issue regarding an accidental keyed mike.....
I understand what you mean about manually programming each channel to TX on 220.000 Mhz, but its not quite what I wanted to do. I'd rather punch in 100.000 Mhz then just set it to scan up through the frequencies until it found an active RX.
I'll certainly keep with it as I dont like to be beaten on much lol. If I can get it to act as a scanner that covers 100 to 999 Mhz without the risk of any damage to the HT then i'll be extremely pleased with its capabilities. I think I paid £45 delivered and it came with a programming cable and cd (I use chirp) so really cant knock 'em at all.....

Thanks for your input Jim

Subject: [baofeng_uv5r] Re: Freq Unlocker

Kev,
I've never used the 'hacked' VIP software myself so I can't give you advice based on hands-on experience, but I might be able to give you a little help.

Take a look at the accompanying text that shows you a list of verified frequencies. See how the list is split into two ranges? We'll call the first range VHF and second range UHF to correspond to the UV-5R's bands.

The verified VHF range goes from 140-181 MHz and the verified UHF range goes from 380-520 MHz. Put 136 and 220 in the From and To settings for VHF0 on the VIP Other page. Then put 380 and 520 in the From and To settings for UHF0 on the same page. The Allow transmit tick boxes are ticked and greyed out on the unhacked VIP software so don't worry about them. Connect the UV-5R up to the computer and write the changes.

With the UV-5R disconnected from the computer, manually program a VHF channel with a receive frequency between 174 and 181 MHz to see if it even works. If it does, program a transmit frequency of 220.000 MHz into the same channel. Since we know that the UV-5R won't transmit in the 220 MHz band, that should work as your TX inhibit.

Program a UHF receive frequency like you normally would, except switch to the VHF band and program 220.000 MHz for the transmit frequency as well. So basically for every channel that you program, you will program 220.000 MHz at the TX frequency.

Remember... I have not tried this so this is all a big SWAG on my part. Let us know if this does or doesn't work. If it does, you will just have to experiment where you upper VHF limit and lower UHF limit should be on VHF0 and UHF0. If you figure that out, let us know that too.

Good luck,
Jim KC9HI

>
> Hi there,
> Im new to the group and so far like what i see :O)
> Ive just received my UV-5R and so far so good, im having alot of fun learning its capabilities. As I have not applied for my Ham Licence yet Im not using it as a transciever and would like to know how the unlocker enables the HT to rx 100-999 mhz? I've managed to successfully patch the HT to the extended 2 mtr and 70cm frequencies but wondered how you input the freq 100-999? Where do you put these numbers? There is obviously 2 band 'areas' in which you input the extended frequencies, which one do you put the 100-999 mhz?
> Also, there are two tick-boxes which can disable the TX but these seem to be greyed out?? I cant untick them unyet feel it is necessary to disable the TX for safety reasons. I dont want to be catching the PTT and causing a problem with my HT....
> Can any one advise me please. Personally I love this HT and have had NO issues whatsoever with it! The cable works fine, it charges well, is a great size, sounds brill etc etc. Up to now I really cant fault it. Now to register for my foundation licence and get some experience at our local Ham club.... :O) I've not attended just yet as ive been busy so relying on you peeps to help me with this little issue ive come across.

>There are several. Search for "female universal kenwood".

I did that, only one was $3.79. It did not mention Baofeng.

>Or look at item 170735397155 for an example.

This one did not mention Baofeng either.

I bought 271010902869 , the seller wanted another $1 for Baofeng model.

I think there is some confusion going on here....

Hi Donn,

That is a little harsh, this LCR has given me, and a load of others, a lot of fun. Sometimes, the shortcomings actually give pleasure as you get to the bottom of it.

Nothing is perfect, even from the big Jap manufacturers, but their price is a long way from "perfect", whereas the Baofeng is a "perfect" price, given what you get, for what you pay.

I think many will agree with me that these radios are disposable. That is to say, few will shed a tear as a result of some catastrophe to the radio, although we will no doubt strive for that not to happen.

But for me, and I suspect many others, the radio has given much pleasure in a short space of time, and revitalised my VHF/UHF operation.

It has also worked well, if not perfectly, and the cable issues (experienced here) have been solved as a result of the help from the great guys you will find on this group.

Go on, take a punt, and use it to destruction. You'll have a load of fun along the way...

I have a UV-3R plus as well. Also a pile of crap. And all the foregoing applies to that too, Hi Hi :-)

Regards and 73,

Stan, G4EGH

well, it has been mentioned about 5 or six times since I joined the list
last tuesday...it peaked my interest and I remembered that someone posted an
ebay link, so I did a search for antenna in the last 60 or 80 messages and
found the ebay link and model number of the antenna.
J0125A...I did a search on ebay and found the cheapest seller with free
shipping to Canada.
It's not 3.79 any more though, prices have gone up...the cheapest I found it
was for $3.86US but that was from a seller than only had 932 feedback, so i
went with the $3.99US version with free shipping where the seller had feed
back of over 14000 and 98 per cent plus rating.
there are probably 20 sellers of the J0125A SMA female on ebay most with
free world wide shipping.

the seller I bought mine from was saleseshop.
they promptly sent me a personal email to let me know about approximate
shipping time and info about payment etc...I know it was a personal email
based on the details and the interesting chinglish content :)
I'll update the results when the antennas arrive.

so buy what you think is good and leave the rest to people who don't mind spending a hand full of dollars, and will spend more than 5 seconds trying to make it work.
if you think it's cheap, pay tripple when you buy the cable so it makes you feel better about the product you are getting...and pretend it's made in say, montana, or florida or something and it won't hurt your ego so much.

Agree..I have a Yaesu FT50RD and it's unusable. Got bad reviews in QST because of ergonomics (who the heck puts the PTT on the corner of the radio?). I take the UV5R along because it's usable, works well, seems rugged enough (dropped it twice while hiking the Grand Canyon recently...no problems.) Works as well as I want it to, so no complaints.

I didn't think the chip in the baofeng UV5R was even capable of receiving that high...even if it was, filters and all sorts of stuff would prevent any usable rx above 512...
this website you referenced, what is it? seems like a step by step guide for something, but it doesn't state radio type, brand, model or what software it is refering to.
Not saying your wrong, just more info would be appreciated.

Hi Jim,

Thanks for your reply mate.
Right....I've pretty much understood what you've said there but its not quite what i'm asking, if that makes sense....
Basicly what i'm looking for is to turn my HT into a receiver with the freq 100-999 Mhz available but WITHOUT the risk of catching the PTT Button and causing an output chip to blow.
If I read this correct http://f1.grp.yahoofs.com/v1/ELs-UGlNAJx_849VpkubERiNl73hEZ9Zyu1YHU0eP5R1HYfj7vFZguRIWCZOiFXU_-Vz-nXzJ9uEiCN59LEl2WzN0Qh0MZs9CMbXGtUh7MNd3DETsujv2W5L/UV-5R%20Freqency%20Unlocker/Instructions I cant see any reason why I cant do it, Im just unsure as to how and where to put place the freq range i.e. 100-999 mhz. I've had a little time to sit and ponder the issue and i'm wondering if i'm meant to put in the vhf boxes 100 up to 300 then in the uhf boxes, 300 up to 999?? That seems feasible to me but it still leaves the issue regarding an accidental keyed mike.....
I understand what you mean about manually programming each channel to TX on 220.000 Mhz, but its not quite what I wanted to do. I'd rather punch in 100.000 Mhz then just set it to scan up through the frequencies until it found an active RX.
I'll certainly keep with it as I dont like to be beaten on much lol. If I can get it to act as a scanner that covers 100 to 999 Mhz without the risk of any damage to the HT then i'll be extremely pleased with its capabilities. I think I paid £45 delivered and it came with a programming cable and cd (I use chirp) so really cant knock 'em at all.....

Thanks for your input Jim

Subject: [baofeng_uv5r] Re: Freq Unlocker

Kev,
I've never used the 'hacked' VIP software myself so I can't give you advice based on hands-on experience, but I might be able to give you a little help.

Take a look at the accompanying text that shows you a list of verified frequencies. See how the list is split into two ranges? We'll call the first range VHF and second range UHF to correspond to the UV-5R's bands.

The verified VHF range goes from 140-181 MHz and the verified UHF range goes from 380-520 MHz. Put 136 and 220 in the From and To settings for VHF0 on the VIP Other page. Then put 380 and 520 in the From and To settings for UHF0 on the same page. The Allow transmit tick boxes are ticked and greyed out on the unhacked VIP software so don't worry about them. Connect the UV-5R up to the computer and write the changes.

With the UV-5R disconnected from the computer, manually program a VHF channel with a receive frequency between 174 and 181 MHz to see if it even works. If it does, program a transmit frequency of 220.000 MHz into the same channel. Since we know that the UV-5R won't transmit in the 220 MHz band, that should work as your TX inhibit.

Program a UHF receive frequency like you normally would, except switch to the VHF band and program 220.000 MHz for the transmit frequency as well. So basically for every channel that you program, you will program 220.000 MHz at the TX frequency.

Remember... I have not tried this so this is all a big SWAG on my part. Let us know if this does or doesn't work. If it does, you will just have to experiment where you upper VHF limit and lower UHF limit should be on VHF0 and UHF0. If you figure that out, let us know that too.

Good luck,
Jim KC9HI

Dave, the price was originally $3.99. It went as low as $3.20. If it was the "J01250A", it will work on the UV-5R just fine.

It does not mention Baofeng but that does not mean it will not work. This antenna fits the UV-5R very well, along with I'm sure a large number of other radios. Antenna ads cannot possibly list every specific radio their antenna mates with--that list would be huge.
The key thing you need for compatibility with the Baofeng UV-5R is an SMA-female connector on the antenna, to mate with the SMA-male connector on your UV-5R. With some antennas there is a "gap" issue in that they don't screw all the way down onto the radio body. This can be fixed with a washer, although I consider that largely cosmetic. This particular antenna does not have that issue--it fits perfectly.
I hope that clears up the confusion. It's much easier to find a compatible antenna than say, a battery, which MUST be made for the exact radio you have.

Kev,

Read my post again. I explained what to put in the boxes. Start out with a smaller, known good range (according to the author(s) of the hack) and then expand the range.

I don't think you can get a continuous 100-999 MHz range in either band. It will most likely be two ranges, VHF and UHF (just like I explained). I told you to start where the instructions said to start. I wanted you to start where the expanded frequency range is supposedly known to work to try it out, then you can expand the range lower and higher once you know it works.

I don't know at what frequency the VHF/UHF split needs to occur. For all I know there may even be an overlap. I'll be surprised, but who knows, you may even discover that you CAN put 100 in the From and 999 in the To. You need to be the one to do this experimenting to figure it out.

"Note: check the other txt document for working frequencies, 100-999 is programmable and you can RX on all of them"

The above statement is from the document included with the hacked VIP software. You have to read it slowly and carefully because the way it is written it is real easy to misunderstand.

"100-999 is programmable" means pretty much what it says. If is is between 100 and 999 you can enter it via the keypad and save it to a channel.

"you can RX on all of them" This is the part that can be easily be misunderstood. "THEM" is referring to the working frequencies in "the other text document", NOT the 100-999 range. Sorry. But there are going to be gaps. 220 MHz is one of them. This was established months ago. Think about it. If all of the frequencies in the 100-999 range worked, what would be the purpose of a 'Tested Working Frequencies" list?

Once you write whatever expanded range you come up with to the UV-5R, you should be able to go to VFO/Frequency mode, select the VHF or UHF band, key in the lowest frequency of that band and press the SCAN key. The UV-5R should scan all the way up to the upper limit for that band and wrap around. I just figured that would be boring and told you how to store working active frequencies into channels in a way that 'should' disable the PTT.

But if all you want to do is scan while in VFO mode, then be sure to set the Menu 25 to + or - and Menu 26 to the largest offset that you can enter (I believe it is 69.950 MHz). Do it for both the VHF and UHF bands because they are separate. On a non-expanded UV-5R this effectively disables the PTT. Hopefully this 'trick' will still work on a UV-5R with hacked band limits.

Good luck,
Jim

I use it quite a bit. I used it last weekend during a SAR mission to find my helmet that I foolishly set down with my attached headlamp off (to save batteries).

I use it when hiking at night.

I use it when searching for stuff in my car.

I use it to get down the hallway in the dark when I'm on this forum too late and finally decide to call it a night.

For a guy who always carries two flashlights, I really do use it quite a bit. It's a stupid feature but I'd rather have it than not. I love my little UV5R. It's swell.

Did I mention I use it quite a bit?

+1 on the <$4 (aka $3.79) antenna.

Mine performs very well.

My 2 cents, for what it's worth...

The majority of the problems experienced with the UV5R
circle around the programming cables and the drivers.

The blame, however, always goes to the cheap $50 radio.
But Baofeng doesn't make the cables.

I've owned some Kenwood and Icom HTs in the past.
Some were good and some were, shall we say, not so good.

Looking at other Yahoo Groups, YeaComWoodXon owners with the
improper cables are having the same issues.

In My opinion, this $50 radio does one heck of a job and has
some features other don't.

I'm sure Boafeng isn't happy about the counterfeit chips
eihter.

Thanks Paul !

According to some folks that I admire, "for every action there is an equal and opposite reaction" or some such and you proved the point. Next we will hear from a person who was stuck below ground level and didn't want to see the rats but was rescued because the LCR had a little noise maker on it.

Me ? I am waiting for the issue that dispenses ice cubes and scotch, I'll pay $70 for that one!.

I make light of a serious situation, to keep it light. Stay safe and God Bless.

JL

Subject: [baofeng_uv5r] Flashlight feature

I have a major announcement here...

Due to the power outage at the club station from Hurricane Isaac, we actually made use of the UV-5R's LED flashlight function several times.

I had previously thought this feature was totally useless. It is not.

It is actually the alarm/siren that is totally useless.

That is all. You may return to your previous discussions.

I must concur - the flashlight feature has been highly useful in one
time over two months of owning the UV-5R.

The siren feature is of less than zero value, as it is of extreme
annoyance, and can be quite alarming when using the supplied headset at
a reasonable volume.

try as I might, none of the 3 settings in menu 32 allow the radio to
transmit that alarm as with previous baofeng models...am I doing something
wrong, or is it just a plain audible body alarm thing?
Hugely entertaining when the repeaters get borring...proceeded and
immediately followed by ones call sign of course...

7064. Re: Freq Unlocker

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-30 03:52:32 UTC
From: Jim
Topic: 7024 Message: 7064

Colin,

The 'Freq Unlocker' hack Instructions claim that the software allows you to program frequencies from 100-999 MHz in the UV-5R. It does not claim that all frequencies in this range are useable. In fact, the hacked VIP software comes with a "Tested Working Frequencies" document in which there are very few working frequencies listed that are outside of the range that we can already program using CHIRP. It doesn't hack the Channel Information page frequency limits, so any expanded frequencies have to be entered and programmed via the keypad.

The document referenced was the so-called 'Instructions' for the hacked program which is save in the files are of this group along with the 'Tested Working Frequencies' document and the hacked VIP software.

I still haven't used the software. There's probably nothing wrong with it, but to me an admittedly hacked software from someone I don't know, that apparently disappeared as quickly as he appeared, deserves some measure of caution. Has anyone taken a chance and tried this?

7066. Slim Jim Antenna with UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-30 03:58:50 UTC
From: drewzhrodague
Topic: 7066 Message: 7066

I did some cursory research on an external antenna to use with my UV-5R, and came across this one - I've used this twice:

http://www.2wayelectronix.com/Dual-band-2m-70cm-Slim-Jim-Antenna-with-16-rg-58-dual-slim-16.htm

Normally I use this Nagoya 771, which works really well when compared to the supplied antenna.

I'm in a first-floor apartment, in a ditch, beside a highway. I mount this thing on a tall piece of wood trim, which I attach to a tripod outside. I'm able to hit more repeaters than with the 771, and have had some good quality reports using this Slim Jim antenna.

I have an HT-saver cable, SMA-F/SO-239, which fits into the Slim Jim. I expected to use the SJ with another radio in the future, so opted for the HT-saver cable.

I don't know for sure.... but I have been able to make anything appear possible with software that can't be produced by the associated hardware..... they are two very different parts of this dicussion.

One can make the other function only within the design specs of the other. You can program AM but if the hardware can't play it, you are history. The software program looks good and then it blames the hardware for not performing up to the expectations of the software..... almost sounds political ??

Colin,

The 'Freq Unlocker' hack Instructions claim that the software allows you to program frequencies from 100-999 MHz in the UV-5R. It does not claim that all frequencies in this range are useable. In fact, the hacked VIP software comes with a "Tested Working Frequencies" document in which there are very few working frequencies listed that are outside of the range that we can already program using CHIRP. It doesn't hack the Channel Information page frequency limits, so any expanded frequencies have to be entered and programmed via the keypad.

The document referenced was the so-called 'Instructions' for the hacked program which is save in the files are of this group along with the 'Tested Working Frequencies' document and the hacked VIP software.

I still haven't used the software. There's probably nothing wrong with it, but to me an admittedly hacked software from someone I don't know, that apparently disappeared as quickly as he appeared, deserves some measure of caution. Has anyone taken a chance and tried this?

RG-58 is like a soaker hose on UHF. Even 8X almost usable there.
Keep the run real short.

RG-6 is surprisingly good, easily available worldwide and cheap. Triple shield is fairly common, quad shield is better but you have to look for it, cable TV and satellite dish installers often have "short ends".

You buy compression, NOT crimp on, connectors, and they work very well and are sturdy. F are the most common, you can buy BNC ones from eBay. Then you buy adapters to whatever you need on the radio and antenna.

Geoff.

I purchased the same and am very happy with it. I'm near sea level in the shadow of a small mountain, but I've had exceedingly good results on 70cm, a bit less so with 2m, but order of magnitude better than rubber ducky. I can hit repeaters 40mi as the crow flies with the Slim Jim.

As for cabling, I was concerned after learning the RG-58A/U used is very lossy, but I have a run of about 36ft and haven't noticed any degradation when measured against the 16ft stock length it came with - I extend it with a dual female BNC, and another length of 20ft with bnc connectors.

Drew, a friend of mine and I both bought this roll-up slim jim from K9TAX at 2wayelectronix.com. I've used mine for various portable operations.

My friend moved into a retirement community / assisted living place and had to give up his HF gear, but uses his Yaesu HT with the slim jim hung from the ceiling in his bedroom. He easily hits all 10 repeaters in the Pensacola, FL area.

This antenna performs as advertised. Here is a review.

I've used it. Found some adapter cables at a hamfest one year that have PL259 on one end and F on the other. A few barrels and I'm on the air with whatever length happens to be handy. I'm not worried about a 1.5:1 SWR. If it's below 2, I'm happy. 1.5, I'm done. 2.5 & I start checking stuff... SWR is not the only indicator of an antenna's performance. It's just a ratio of impedances that determine how well the power transfers from the source to the load. A 50 ohm resistor shows a great SWR but won't radiate very well.

Time to flip my fingers and me horizontal for a bit.

RG6 is 75 ohm coax, not 50 ohm coax like you really need. While I agree that SWR isn't the entire story, when you are starting with 5 watts, every db counts. I would not use RG6 as it is harder on your little transmitter and it will cause it to over heat and possibly fail.

You'll find that RG8X is as good as long as you keep the run short.

100ft at 100mhz is about 3.6db or 1/2 your power.

RG58 is 10db loss at 400mhz, meaning you are losing 10x your power (both in transmit and receive)

You can look at this chart and get an idea
http://www.w4rp.com/ref/coax.html

Remember, every -3db is 1/2 of your power. -6db is 1/4. -9db is 1/8 loss. -10db is 1/10. -13 is 1/20 and -20db is 1/100th.

You forgot the IMHO.

IMHO the difference between RG-6 and RG-8X on your transmitter is
negligible.

If an SWR of 1.5:1 has any effect on an HT, it would explode on some
frequencies with any one of a number of rubber ducks, including the one
provided with it.

They have an SWR of 1.5:1 (or less) in a very narrow range.

Geoff.

When I was checking my antennas, the SWR and even the frequency of minimum SWR changed according to how and where I was holding the analyzer.

You may find one case where the antenna gives 1.5:1 SWR, but it almost certainly won't be 1.5:1 when you are actually using it.

Spent some time this morning using my MFJ 269 Analyzer checking several SMA antennas I had around the shack.

Without going into detail - of course the smallish ones are VSWR horrible. Several of my larger one's including my factory antenna are >2:1 at 146.00 Mhz and around 1:5 on UHF

I have no financial interest but an inexpensive model manufactured by WEP had the best VSWR of them all. It is 7 1/2" long and mine required two small rubber O-rings to make it fairly tight and unobtrusive on my UV5R. It's VSWR at 146.00 is 1.3:1 and <1.6:1 on the entire UHF band.

Again I have no financial interest but they are available here for 9 BUX: **(Web site says "Free Shipping")** Save a few BUX for us old cheap farts.....

http://www.k1cra.com/catalog/product.aspx?productID=958

A simple search for "WEP SMA HT antennas" will reveal several sources.

YMMV .....Mac

7086. simple problem I bet, but it has me stumped!

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-30 11:11:28 UTC
From: shane_vor
Topic: 7086 Message: 7086

We have one of these radios here and when it first arrived I locked it from TX (it's owner wasn't licensed), but now that he finally is I've tried to 'unlock' it and write a new profile for it. Trouble is when I test it, carrier is okay and it's accessing local repeaters but there does not appear to be any modulation. I don't have a spectrum analyser so can't put it on that. I've used the VIP CPS but I'm not sure if I've missed something really obvious? Just on simplex it does seem to modulate. I'm fairly certain it worked when it first arrived (I would have tested it yes?). A search on this group failed to find an answer.
So what have I missed, can anyone help please?

Thanks Geoff, I have another radio as a monitor. I assume that's what you mean by your question. I can see the radio transmitting a carrier. I can hear repeater tails. So it's accessing. Just no audio transmitted....

I assume you mean you have another radio NEARBY. The nearby radio is
being desensitized by the signal from the transmitting one. Have someone
go away about 20 to 30 feet, and it should be ok.

Geoff.

Thanks for the quick responses Geoff. I would have thought the same thing, but we first realised there was a problem when the radios were 500 metres or so apart. Turns out I may have nailed it. When I fit the external mic it works fine. So maybe I'm now looking at a faulty socket? Out with the screwdrivers!!!

Good luck. Before you take it apart, try moving the mic plug in and out
a few times, it may start working.

Geoff.

The Chirp .img files are hardware specific. You need to get into the import/export business. You can export the memories from one HT, save them as a .csv file and import that to the Baofeng.

Bear in mind that the VSWR of an antenna is different on a radio than on
an analyzer, and even more different when that radio is in a hand and
not on a table, or in a cup holder, etc.

You do however prove my point, that HT's must be able to withstand wide
ranges of VSWR if they cover a wide bandwidth.

Even if you modify the receiving range, it won't be any good to you.

118-137 (Aircraft band) all in AM mode. Your radio is all FM mode.
There is no AM demodulator, so you won't understand a thing.

You can google for "chirp radio programming"

Hi..

I'll second Geoff's opinion. My vhf/uhf antennas are wired with either RG6 or RG11 75ohm cable, all double shielded. Triple shielded would be a bonus, but can be hard to work with. Neither my transceivers or handhelds have a problem with loading into the 75ohm lines. Cost savings can be significant.

Jimmie

OK....

Well, I agree with Geoff, again. My last message was "short", and there are several things I didn't mention.

First, I've used the RG6 and RG11 cables for a long time at UHF/VHF, with handhelds at 1 or 5 watts, transceivers to 40w, and amplifiers to 100w. The antennas have changed several times over, from jpoles, ground planes, discones, vertical dipoles and beams. I've never had a problem with either destroying equipment or power foldback.

If we are a handheld manufacturer, what impedance would we design output network for ... 30, 40, 50, 60, 70 ohms? How much does the output impedance change when the handheld is put into a holder, on a belt, or held to the head. How about when the antenna orientation is changed? Its going to be all over the place because it interacts with its surrounding. The manufacturer has designed it to be "robust". Anyone with an antenna analyzer can tell you the same thing.

So, lets have a little faith, do some experimenting, and have some fun.

73, Jimmie, K9JFK
